PIONEERING ADAPTATION SOLUTION FOR VULNERABLE ISLAND AND COASTAL TERRITORIES:
SYMBIOTIC AND BIOPHILIC SMART OFFSHORE ECOSYSTEM

Indigo Civilization
the ocean dwellers

01/2026

SUMMARY

PAGES

In a few words...

Building a new, sustainable and mutually beneficial relationship between humanity and the ocean

1.

The collaboration of two pioneering players to co-construct an exemplary future in symbiosis with the Ocean.

Indigo Civilization x Bora Bora (FP)

2.

A sustainable development strategy to transform the constraints of island and coastal territories into opportunities: adaptation to climate change, preservation of natural heritage, economic diversification, regenerative tourism, food and energy self-sufficiency, socio-cultural resilience.

Symbiotic Blue Economy

3.

An offshore regenerative spatial and functional model allowing biophilic synergies that benefit all stakeholders: local community and biodiversity, economic actors and tourists.

Smart Offshore Ecosystem

1.

GLOBAL CONTEXT

CHALLENGES OF THE FUTURE

Future global challenges

In 2050…

Scarcity of land and depletion of resources: the world's population would grow by 26%. The need for accommodation would increase accordingly and 50% of the population would be concentrated within 100 km of the coast.

Rising waters and floods: 1 billion people would see their terrestrial environment flooded and would be forced to migrate. Most of SIDS are particularly threatened (overall 65 million individuals).

Lack of drinking water: 52% of humans would suffer from chronic water stress in their environment and a lack of access to drinking water.

Food challenge: using the current intensive techniques of agriculture, an additional 22 million km^2 of arable land would be needed to feed the population, the equivalent of North America. According to the UN and Nature Journal, global demand for food and seafood would roughly double.

Energy challenge: global energy consumption would increase by 68%.

Pollution: CO^2 emissions would increase by 35% in countries with the highest population growth.

Loss of biodiversity: Nearly 90% of land animals could lose their habitat with current farming methods. 90% of coral reefs, home to 25% of the planet's marine biodiversity, would disappear.

Collateral threats: according to MIT, 4 societal consequences are also to be expected (famine and malnutrition, migration, conflicts / geopolitical, and diseases).

Sources: IPCC, NOAA, AIE, OMM, Growing Blue, WEF, MIT, UN, Blue21

Future Ocean challenges

2050

Projection

To address future global challenges, humanity will increasingly rely on the ocean as a "toolbox."

The Blue Economy is expected to grow by 55%, reaching $5.1 trillion, leading to more people working at sea and offshore —away from overcrowded coastal areas.

About 400 million people living on islands or coastal territories will face threats from rising sea levels.

For reasons of adaptation, work, productivity, and impact, humans will settle at sea — temporarily or permanently — transforming the ocean into a new frontier for living and working

▶ More information

Threats

Tens or hundreds of million people may be forced to migrate and leave their homeland.

The Ocean could be then perceived as the new space to be colonized and could arouse many covetousness and abuses.

Marine biodiversity could suffer even more...

Opportunities

Anticipating a new relationship Humanity – Nature.

Learning to live in symbiosis with the Ocean for a sustainable Blue Economy.

Experimenting a complementary transformative solution to rising sea level demonstrating it is not necessary to fight or flee the sea to be resilient and to adapt.

2.

OUR TRANSFORMATIVE PROPOSITION

SUSTAINABLE DEVELOPMENT AND ADAPTATION FOR ISLAND OR COASTAL TERRITORIES

NOTA: the hereafter inspirational illustrations are intended to share a preliminary principle as an early intention, and not a completed project.

Indigo Civilization's mission

Inspiring a harmonious relationship between humanity and the ocean

Mission

Our goal is to anticipate the future growth of the blue economy and the anthropization of the seas by creating a symbiotic relationship with the Ocean to transform challenges into opportunities.

Our mission focuses on adapting to the impacts of climate change such as rising sea levels — without fighting or fleeing the sea — while supporting the resilience and prosperity of vulnerable coastal and island communities and marine life.

Action

We offer a forward-thinking solution initiating the sustainable development of a symbiotic offshore blue economy.

Indigo Civilization federates and leads an international network of multidisciplinary expertise to co-construct, experiment and validate viable adaptation models.

From consultation to R&D and operational execution, we bring together project stakeholders and ensure their respective interests and buy-in:

1. Territorial actors and local civil society,
2. Economic actors and investors.

Structure

Indigo Civilization is a purpose-driven entity non-profit and recognized as being of general interest, legally registered in France in 2023 under the RNA number W784011015.

Indigo Civilization has created an ecosystem of partners and complementary expertise such as oceanology and marine biology, maritime architecture and engineering, pollution and waste management, marine renewable energy, marine permaculture, economic engineering, mesology, law and governance and regenerative tourism.

Our solution: Smart Offshore Ecosystem (SOE)

To transform constraints into opportunities

1.

Floating maritime territorial extension with a double positive ecological and financial ROI: multi-use and mutualized, modular, biophilic and self-sufficient.

2.

Offshore location*, within territorial waters, to alleviate environmental and anthropogenic pressures on the coastal and lagoon ecosystem.

3.

Blue Carbon Ecosystem composed of sustainable and profitable co-activities derived from deep sea cold rich-nutrients waters, and renewable marine energies such as OTEC.

4.

Concept foreshadowing an opportune solution empowering local communities: adaptation to climate change, autonomy, socio-cultural resilience, economic diversification.

Concept d'inspiration préliminaire par Simon Nummy

** Anchored on a sea shoal or in the open sea relatively close to the coast*

Our sustainable objectives

Symbiotic ecosystem,
Laboratory of the future, global pilot

Self-sufficiency,
Sustainable and profitable economic growth

Resilience of living beings,
Adaptation to global change

Blue Carbon Infrastructure,
Incremental trophic Web

Educational Eco-Tourism

Marine and Underwater
Research Station

Our first pilot territory

Bora Bora, the pearl of the Pacific

Beyond the exceptional splendour of its natural environment, its favourable climatic context, and its reputation as a high-end tourist destination, this **pioneering territory** has gradually established itself, over the past twenty years, as a **real living laboratory for sustainable development for small island territories**. Bora Bora and French Polynesia illustrate many of the realities of most of vulnerable island territories, which are facing current and future environmental and socio-economic challenges, particularly in the face of climate change and sea level rises (see in Appendix). Besides, the Polynesian cultural heritage and the deep link that unites the People of the Sea to its ocean are assets to nourish and stimulate the collective imagination.

Our long-term collaboration, notified through a MoU signed in January 2025, is based on four pillars: preserving natural heritage, improving the well-being of communities, achieving economic autonomy and becoming an eco-exemplary model for other vulnerable territories around the world. About 600 hectares of its lagoon are now fully protected from anthropogenic activities and entail to find new ways ton collaborate with the Ocean. **Our project is a logic continuation of the sustainable development actions carried out on the island** (partially funded by the European Union as part of the IANOS / SWEET 1 & 2 projects).

Island of Bora Bora

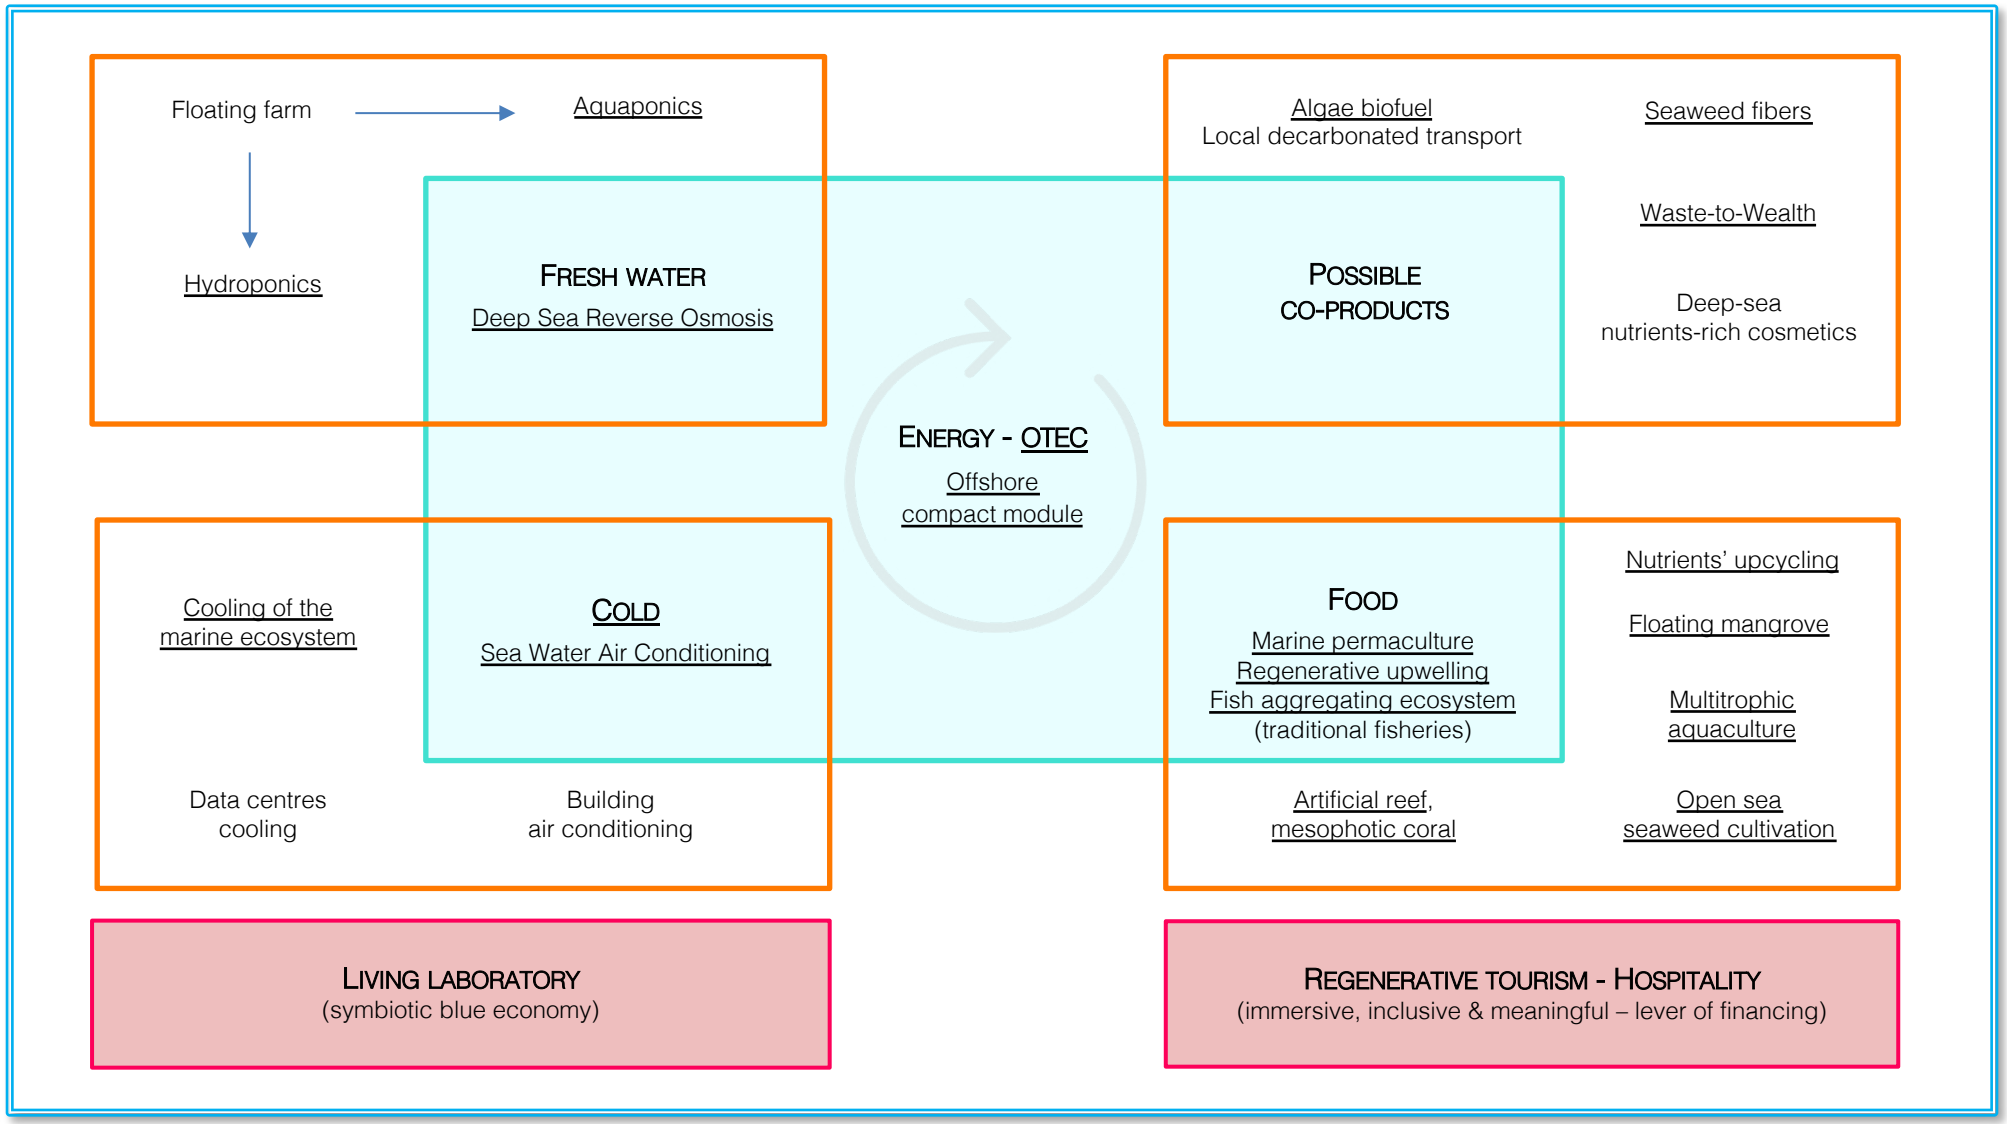
Atoll of Tupai

SOE'S POSSIBLE FUNCTIONAL CO-ACTIVITIES AND SYNERGIES

EXAMPLE OF A SELF-SUFFICIENT SYMBIOTIC ECOSYSTEM USING OCEAN THERMAL CONVERSION TECHNOLOGY (SEE APPENDIX 7)



Architectural & spatial philosophy

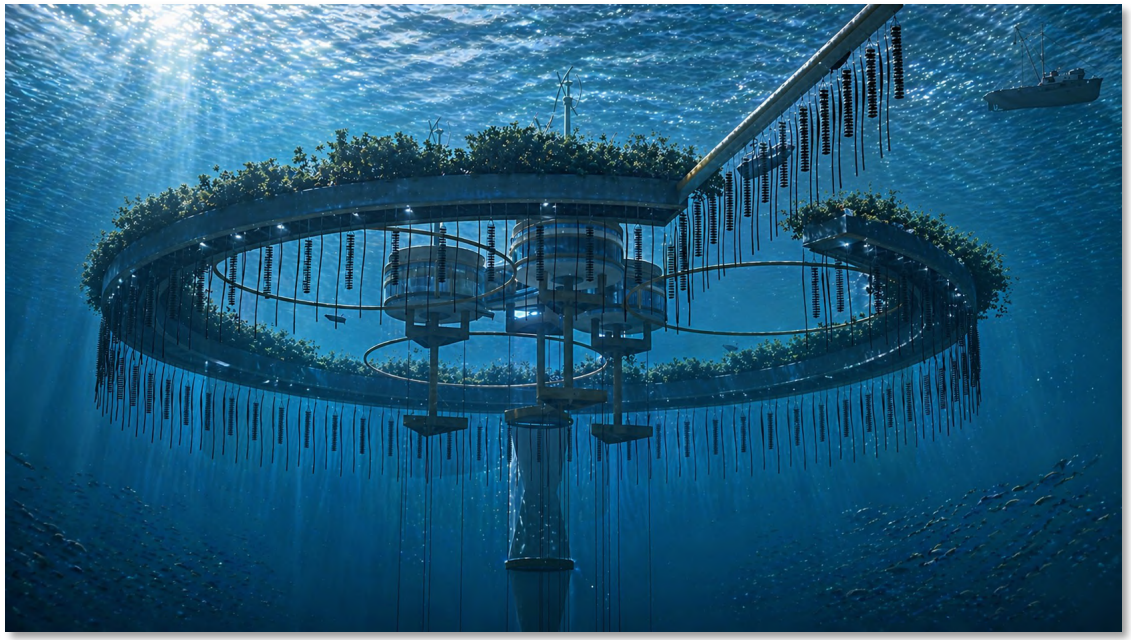
Modular & safe – multi-use & synergistic - respectful of local culture

Concept d'inspiration préliminaire par Waterstudio

Small circular Tensioned-Leg Platforms (⌀ 30m), designed for deep water (up to 1,500m), built onshore and resistant to tropical storms (⊱ cat. 3) and 5m waves. For maintenance or even safety reasons, these circular platforms can be moved outside the SOE or replaced.
To understand the technical principle of Tension-Leg Platforms, consult Appendix 6.

Symbiotic philosophy

Integrated blue ecosystem with a negative carbon foot-print



Concept d'inspiration préliminaire par Simon Nummy

Platforms surrounded by a circular breakwater infrastructure to protect the Smart Offshore Ecosystem from swells and waves. This biophilic barrier is home to floating mangroves, the starting point of a blue carbon ecosystem.

Biophilic philosophy

Facilitating a new incremental trophic web

Preliminary inspirational concept design by Waterstudio

The floating infrastructures of the Smart Offshore Ecosystem aim not only to be as minimally invasive as possible, but to be conducive to the development of a new marine trophic web and an artificial reef.

WIN-WIN COLLABORATION

MAIN STAKEHOLDERS' OPPORTUNITIES

	BORA BORA, FRENCH POLYNESIA	INVESTORS LOCAL ECONOMIC ACTORS	INDIGO CIVILIZATION
MID-TERM	Proof of concept of an efficient model of sustainable development and a sustainable economic hub. Exemplary lever of prosperity and pride amongst the local community and future generations.	Future growth lever, financed by revenues from an exceptional responsible tourism in a buoyant market, and the co-products generated by SOE - energy and food in particular.	Growing public awareness and social acceptability thanks to the validated proof of concept of an integrated symbiotic solution featuring a pioneering offshore spatial planning.
LONG-TERM	Polynesian sector of excellence and global showcase of replicable adaptation solutions transforming constraints into opportunities: consequences of climate change, self-sufficiency, cultural resilience, symbiotic way of life, economic thriving and well-being.	Opportunity to scale up a fair but profitable sustainable economic model thanks to a network of Smart Offshore Smart Ecosystem in the world.	Replicability / scalability of the concept to support the resilience and adaptation of other vulnerable island and coastal communities and biodiversities.

In accordance with our Code of Conduct, our process applies the IFC Performance Standards – World Bank

3.

THE OPPORTUNITY TO FINANCE PROGRESS THROUGH TOURISM

BOTH AN EXCEPTIONAL REGENERATIVE TOURIST EXPERIENCE & A LABORATORY FOR AN EXEMPLARY FUTURE

A VISION SHARED WITH THE UN

TOURISM AS A LEVER FOR SUSTAINABLE DEVELOPMENT

The UN, and more specifically the World Tourism Organization (UNWTO/UN Tourism), strongly recommends tourism as a key lever for the sustainable development of Small Island Developing States (SIDS).

According to UN Tourism guidelines, sustainable tourism is considered a key tool to achieve the Sustainable Development Goals (SDGs), including Goals 8 (decent work and economic growth), 12 (responsible consumption and production) and 14 (life below water).

Tourism is seen as a way to contribute directly or indirectly to all 17 SDGs, promoting economic resilience, environmental protection and social inclusion in these territories that are particularly vulnerable to climate and economic shocks.

Advantage for the territory's civil society:
the financing of the pilot of an inclusive sustainable development lever.

Benefit for tourism stakeholders and travellers:
A differentiating tourism experience with a neutral or negative carbon footprint.

Contemporary high-end tourism

Immersive experience made of sustainability, inclusion, well-being & individualization

Customers' drivers

High-end travellers expect slow personalized luxury featuring meaning, wellness and spirituality. Luxury tourism is marked by a quest for emotional, sustainable, and personalized exclusive experiences, driven by innovation

80% of luxury travellers wish to travel more responsibly. For 61% of them, responsible travel means 3 pillars: protection of the planet, support for local economies and cultural preservation.

42% consider choosing a company with strong sustainability policies to be "very important" in their booking decisions.

Business trends

High-end tourism is expected to grow annually by 7,9% till 2035, driven by an increasing number of HNWIs (+ 6,3% in 2024).

Eco-responsible travel at sea is even more attractive. Luxury cruises are expected to grow at a CAGR of 8,2% to reach $22 billion. The floating hotel niche business is expected also to grow at a CAGR of 7.7% from 2026 to 2035 to reach $7.4 billion.

In response to customers' demands, many players in the luxury hospitality industry propose high-end eco-responsible offers: coastal-based resorts (Aman, Six Senses, Banyan Tree…), cruises (Ponant, Explora Journey…), private islands (Tetiaroa, Bawa Reserve, Conrad or St Regis Maldives…).

Opportunities

Designing a carbon-neutral travel offer.

Combining avant-garde technologies with traditional indigenous knowledge to create an immersive and eco-responsible smart maritime experience.

Developing both a profitable business model and a strong image lever by financing innovation and sustainable progress in vulnerable territories, thanks to a targeted strategy of socially responsible investments.

Boosting customers' memorable pride by having a true positive impact on local communities and biodiversity.

A RICH STATE OF THE ART

A GLIMPSE AT THE RESEARCH FUNDED BY THE EU

Beyond the state-of-the-art from indigenous knowledge and decades of experience gained from cyclone proof floating platforms and wind turbines, our work will especially benefit from numerous, mature and emerging technical solutions and research programmes. Our bibliography lists a compelling selection of the available engineering research literature about ocean innovations and floating solutions.

Besides, more than €70 million has been invested by the EU alone in research to study offshore multi-use infrastructures.

- → Tropos (EU): multi-purpose floating modular offshore platforms integrating a wide range of specific activities from different sectors.
- → POMU (France): multi-purpose logistics offshore platform in French Guiana.
- → Mermaid (EU): offshore multi-use industrial platform on 4 European study sites.
- → Space@Sea (EU): sustainable and affordable workspace at sea by developing a standardised and cost-effective modular island with low ecological impact.
- → United Proiect (EU): multi-purpose offshore platform demonstrators to stimulate the blue economy.
- → Musica (UE) versatile power and freshwater generation platform using renewable wind and wave energy.
- → Plocan (UE): multi-purpose offshore platform for sustainable island autonomy in the Canary Islands.

PROCESS OF DEVELOPMENT

PROJECT EVALUATION AND TRANSDISCIPLINARY CO-CONSTRUCTION

Pillars of collaboration

"It is through experience that science and art progress among humanity" - Aristotle

Indigo Civilization federates and leads an international network of multidisciplinary expertise to co-construct, experiment and validate viable and adaptable models. From ideation to operational execution, our non-profit and general interest organization ensures the interests and buy-in of all stakeholders: public authorities, civil society, investors and biodiversity.

Our experimental transdisciplinary methodology combines in-depth state of the art, oceanic foresight, local experimentation, close cooperation between public and private actors, and international collaboration:

- Structuring territorial studies and modelling.
- Implement and interact technological, technical and social building bricks: renewable marine energies, housing, marine permaculture, regenerative architecture, circular economy, governance and insurance, mesology, economic engineering, sustainable tourism.
- Develop an incremental operational pilot and demonstrators.
- Develop efficient, sustainable and viable models for resource-limited settings.

Recommended de-risked gradual process

Phase 1

6 months

Exploration and alignment phase bringing together a multidisciplinary team of international competencies (9 WP):

Public consultation,
Co-construction and project definition*,
Environmental, technical, social, legal, economic framework of investigation,
Marine location assessment,
Pre-design & engineering concepts,
Theoretical business model.

Expected TRL 2
Budget: 100-150 K€
(possible tax deductible amount)

Collective interest validation
Ideation and intentions

Phase 2

24-36 months

Pre-R&D phase bringing together a multidisciplinary workgroup Delivering the following outcome:

Location definition,
Final design & engineering,
Technical feasibility assessment,
Investments and timeline assessment,
Legal / certification / insurance guidelines,
Socio-economic model & business plan,
Benefits / risks assessment,
Physical & digital demonstrators,
Operational & maintenance framework,
Public consultation & approval.

Expected TRL 5/6
Budget according to Phase 1
(ex. In Appendix 8)

Social acceptance & project validation
Private / public collaboration

Phase 3

Lead time according to Phase 2

Preparation and construction of the pilot:

Optimisation and integration phase,
Technical finalization & subcontracting,
Ordering of materials & equipment,
Onshore construction of the modules,
Offshore assembling of the modules,
Training of the construction crew,
Testing phases.

Continuous follow-up ensures that social, economic, environmental and technical stakeholders are properly aligned, and that the project specifications and vision are fully respected.

Expected TRL 9
Budget according to Phase 2

Operational release of the SOE

WORLD BANK ENVIRONMENTAL AND SOCIAL FRAMEWORK

OUR PRIORITY COMMITMENT

Indigo Civilization commits to apply the **Environmental and Social Standards (ESS)** defined by the World Bank as guiding principles of our overall process. This framework has the following **key objectives**:

- **Protect people and the environment** by ensuring that project does not harm communities or ecosystems.
- **Promote sustainable development** by integrating environmental and social considerations into project design and implementation.
- **Strengthen project outcomes** by ensuring that environmental and social risks are managed effectively.

Priority n°1

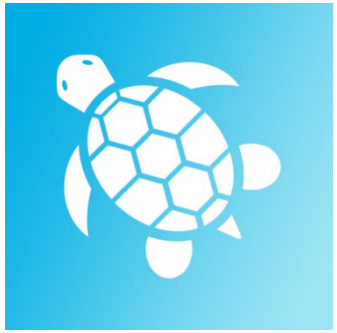
Evaluation of environmental and social risks

ESS 1

Priority n°2

Stakeholder and community engagement

ESS 7 & 10



Priority n°3

Biodiversity conservation Sustainable management of living resources

ESS 6

Priority n°4

Community Health and Safety

ESS 4

Priority n°5

Resource efficiency and pollution prevention

ESS3

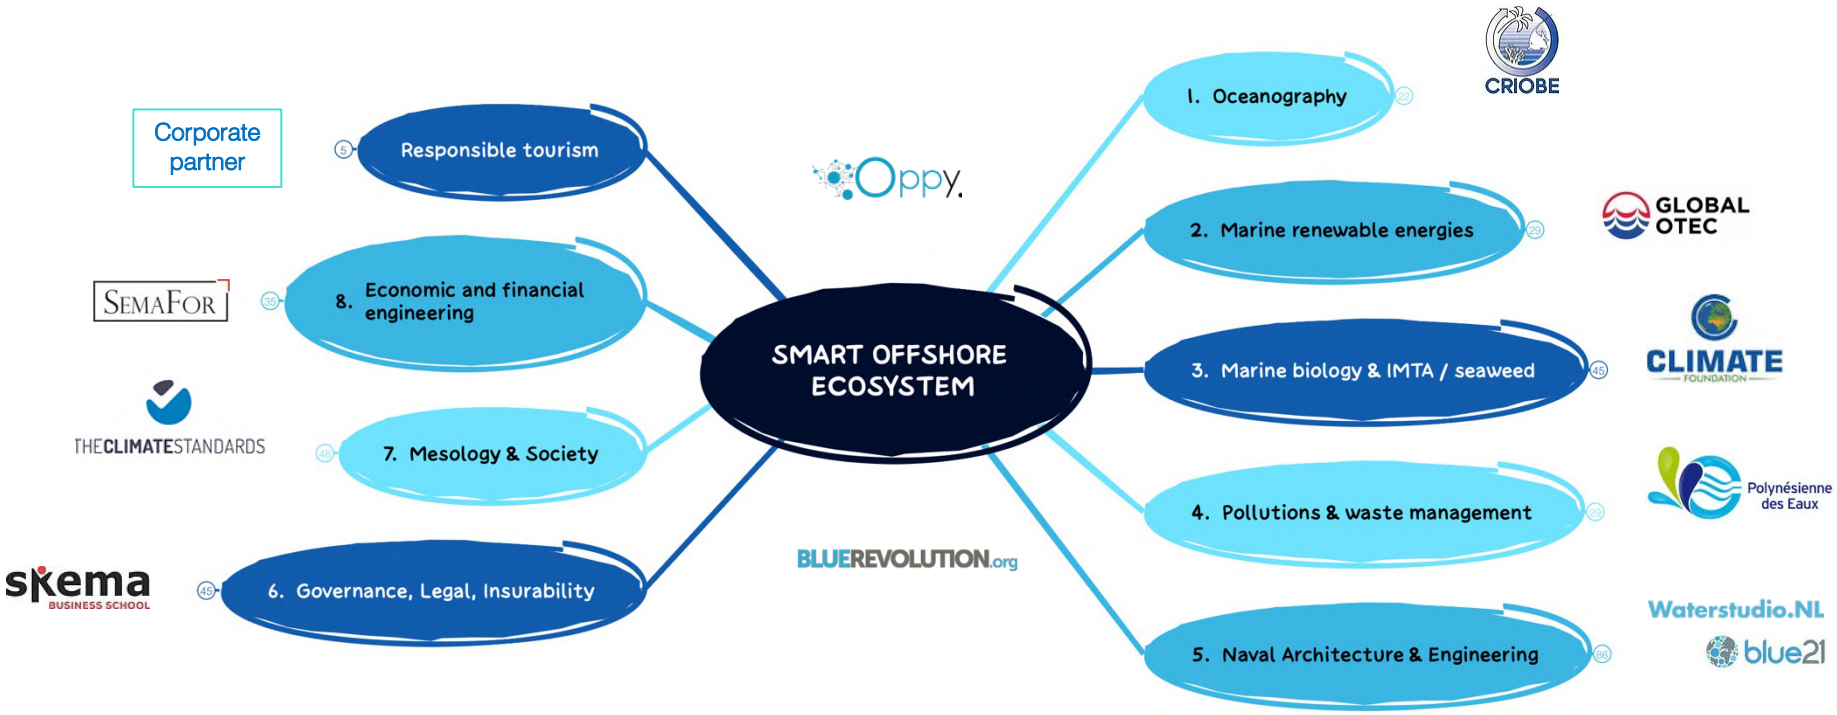
PHASE 1: RECOMMENDED FIRST MILESTONE

COLLECTIVE ALIGNMENT, IDEATION & DESIGN INTEGRATION

ORGANIZATIONAL PRINCIPLES	MAIN MILESTONES
1. Inclusive participatory process bringing together all stakeholders, whether public, economic, ecological or technical. 2. Double Diamond process management, facilitating clarity, liberty and cocreation for a wide range of competencies and participants. 3. Transdisciplinary design integration, making sure open-ended research finds its way to intentional development.	▪ Initial consultation of local stakeholders to understand threats and opportunities : public authorities, civil society, economic actors. ▪ The stage 1 (Discover) unfolds the vision and objectives (Brief v1) in a multidisciplinary collection of scenarios, enabling multidisciplinary team to learn from all the possible perspectives on the project. ▪ The stage 2 (Define) brings the various scenarios together in an integrated multifunctional Smart Offshore Ecosystem (Brief v2). ▪ The stage 3 (Develop) allows all specialists to develop their particular solution meeting the common purpose and objectives (Brief v3). ▪ The stage 4 (Deliver) will bring all this together in an integrated theoretical functional design that is modelled to check the environmental, technical, economic and social relevance of the SOE with stakeholders. ▪ Final consultation to evaluate the relevance to go ahead.

GLOBAL PROJECT MAPPING

TRANSDISCIPLINARY INNOVATION (PHASES 1 & 2)



▶ To enlarge and consult the details of the project map
(password: BoraBora)

TRANSDISCIPLINARY PROCESS

SUMMARY OF THE OBJECTIVES OF EACH WORKING GROUP (PHASES 1 & 2)

DISCIPLINE	QUESTION	OBJECTIVES
Mesology / Society	How can an SOE contribute to redefining a symbiotic human-Nature relationship, a true model of societal progress and a source of Polynesian pride?	• Ensure respect for Polynesian and local culture. • Engage and federate all Bora Bora stakeholders in the co-construction of the SOE model. • Define the sine qua non conditions for the acceptability, desirability and pride of the Bora Bora community regarding the SOE. ▶ To consult the details and KPIs of this Work Package

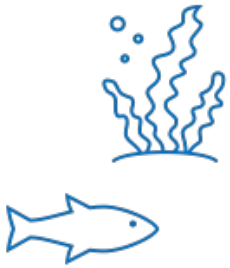
TRANSDISCIPLINARY PROCESS

SUMMARY OF THE OBJECTIVES OF EACH WORKING GROUP (PHASES 1 & 2)

DISCIPLINE	QUESTION	OBJECTIVES
Oceanography Marine Biology	Where can we envisage, beyond the lagoon, between Tupai and Bora Bora, the experimentation of a viable and biophilic SOE, given the synergistic objectives sought by its interdependent co-activities: science, energy, food, freshwater, tourism, biotechnologies?	• Spatial data collection, mapping and modelling: bathymetry, currents, waves, winds, water temperatures, biodiversity (25 km2). • Define the best study location to ensure the safety, sustainability and efficiency of the ecosystem and its co-activities given maritime, climatic and environmental constraints. • Create a floating artificial reef (blue carbon), in sustainable synergy with the other co-activities. • Ensure the biophilic nature of all SOE co-activities. ▶ To consult the details of the WP Oceanography & Marine Biology

TRANSDISCIPLINARY PROCESS

SUMMARY OF THE OBJECTIVES OF EACH WORKING GROUP (PHASES 1 & 2)



DISCIPLINE	QUESTION	OBJECTIVES
Marine permaculture Integrated Multitrophic Aquaculture Seaweed cultivation	How can a new trophic web, a true circular ecosystem (IMTA) be created considering the environmental context and the SOE's envisioned co-activities, particularly in the energy sector?	• Deploy and evaluate a 100 m^2 Marine Permaculture test system in Phase 1, generating empirical data to inform system design, ecological performance, and scalability. • Assess the potential for scaling the system in subsequent phases, ensuring broader impact and alignment with the SOE vision. • To contribute to the food self-sufficiency of the SOE in the short term, and, in a subsequent phase, to that of the island of Bora Bora. • Develop and validate profitable, sustainable, and integrated marine food production techniques capable of scaling to support coastal populations. • Develop virtuous synergies with other SOE activities, particularly marine renewable energy, to support a resilient and circular blue economy model.

TRANSDISCIPLINARY PROCESS

SUMMARY OF THE OBJECTIVES OF EACH WORKING GROUP (PHASES 1 & 2)

DISCIPLINE	QUESTION	OBJECTIVES
Naval Engineering and Architecture	How can we design, model and simulate a modular, safe, biophilic, attractive and multi-purpose floating maritime infrastructure that is cost-effective and located offshore given environmental and socio-cultural constraints?	• Develop a SOE pilot project that is agile and modular enough to allow different co-activities to be hosted and interacting. • Define the required technical solutions: bathymetry, waves and swell, currents, winds and tropical storms, seakeeping, safety and stability, anchoring, longevity and maintenance. • Technically model and evaluate the feasibility and costs of such scalable infrastructures. • Design an integrated beautiful and harmonious architectural project, capable of generating positive emotional valence and pride. ▶ To consult the details and KPIs of this Work Package

TRANSDISCIPLINARY PROCESS

SUMMARY OF THE OBJECTIVES OF EACH WORKING GROUP (PHASES 1 & 2)

DISCIPLINE	QUESTION	OBJECTIVES
Renewable Marine Energies	How can reliable synergies be developed and made reliable from deep-sea water: how can Ocean Thermal Energy (OTEC) be the starting point for a cascade of co-activities such as: production of e-fuel (H_2) + fresh water + promotion of a thriving biodiversity around the SOE?	• Ensure the energy self-sufficiency of the SOE in the short term, then the island of Bora Bora in the mid-term. • Deploy profitable, sustainable and integrated techniques to scale up to help provide coastal populations with energy and other benefits. • Develop virtuous synergies with other activities. ▶ To consult the details and KPIs of this Work Package

TRANSDISCIPLINARY PROCESS

SUMMARY OF THE OBJECTIVES OF EACH WORKING GROUP (PHASES 1 & 2)

DISCIPLINE	QUESTION	OBJECTIVES
Pollutions **Waste management**	How can the SOE be 0 pollution and recover its waste and the nutrients produced on the island of Bora Bora?	• Anticipate and prevent any pollution related to marine and submarine infrastructure, and to the anthropogenic activities of the SOE: solid, liquid, gaseous, noise. • Value the nutrients produced by the SOE and the island of Bora Bora to feed the natural ecosystem of the SOE. ▶ To consult the details and KPIs of this Work Package

TRANSDISCIPLINARY PROCESS

SUMMARY OF THE OBJECTIVES OF EACH WORKING GROUP (PHASES 1 & 2)

DISCIPLINE	QUESTION	OBJECTIVES
Legal (governance, insurance)	What certification, legal framework and governance can be envisioned for this shared infrastructure in Bora Bora?	• Design the necessary marine / maritime legal framework to ensure especially a proper insurability of the SOE. • Describe the management style and the organizational framework to be established. • Identify the roles and responsibilities of the multiple actors in order to ensure the proper functioning, sustainability and insurability of the SOE ▶ To consult the details and KPIs of this Work Package

TRANSDISCIPLINARY PROCESS

SUMMARY OF THE OBJECTIVES OF EACH WORKING GROUP (PHASES 1 & 2)

DISCIPLINE	QUESTION	OBJECTIVES
Economic engineering and financial (economic viability)	How can the SOE be profitable in the medium term and benefit all its stakeholders?	• Setting up a shared, viable and synergistic multiple business model. • Ensure global economic performance of the SOE in the long-term. • Transform a multifunctional economic and scientific hub into an attractive model for all economic stakeholders: local community, investors, operators, tourists… ▶ To consult the details and KPIs of this Work Package

Founding member, Bureau

Frédéric Pons

President

Frédéric Pons, the founder and President of The Indigo Civilization, a non-profit, public-interest organisation, is a French philanthropist and entrepreneur with over 25 years of experience in marketing, strategy, and executive management. Throughout his career, he has successfully developed and launched innovative projects for prominent international brands across diverse multicultural environments.

After a pivotal moment in his life, Frédéric chose to redirect his focus and dedicate himself to a higher purpose, channelling his efforts into a pioneering cause that serves the greater good of all life on Earth. A lifelong admirer of the sea and its mysteries, Frédéric's mission now centres on bringing to fruition the study, experimentation, and deployment of sustainable, desirable, viable and generative Smart Offshore Ecosystems.

To learn how to live in symbiosis with and on the oceans…

Our Strategic Advisor

Jacques Rougerie

For more than 30 years, Jacques Rougerie has based his work on biomimetic, bio-inspired, resilient and sustainable architecture. In this spirit, he has built underwater habitats and laboratories, sea centres, ships with transparent hulls, underwater museums, floating village projects, and a base and a lunar village.

As a child, on the distant beaches of Africa, his friends built tree houses. He wanted to build them under the sea or in space, and become an explorer of the future. Fascinated by Jules Verne's novels, "20000 Leagues Under the Sea" and the voyage "From the Earth to the Moon" and later by the exploit of Gagarin and Commander Cousteau developing the world's first underwater habitat in the same year, Jacques Rougerie saw his destiny transformed by these two great space and oceanic adventures.

"There were no real architectural and technical references to build these new oceanic living environments. It was therefore essential for me to work with a multidisciplinary team and to be inspired by the genius of Leonardo da Vinci who told his students: "Go and take your lessons in nature, that's where our future lies." Because since the beginning of the world, 3,800 million years ago, nature has been drawing the most beautiful shapes, the most elegant curves and making the best materials. It is this biomorphic approach that is at the origin of my creations."

Foundation Jacques Rougerie

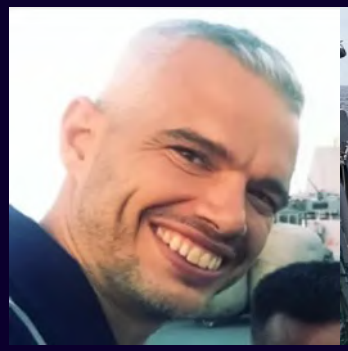
Founding member, Bureau

Guillaume Vichot

Vice-President

Guillaume Vichot is a naval engineer who graduated from ENSTA, IHEDN and AUDENCIA and specializing in maritime projects and contracts management. With a robust background in marine and naval project management, particularly with Naval Group, he has gained extensive expertise in this field. As Managing partner of Oppy International, a marine project accelerator, he develops and manages complex projects for international clients, guiding them from design and industrialization to end-user satisfaction.

In his role, he ensures adherence to Quality-Cost-Delivery objectives and orchestrates a range of interfaces, including Design, Production, QHSE, Purchasing, Supply chain, Customer relationship, End-Users and Local authorities management. Through this, he effectively manages multidisciplinary and multicultural teams, ensuring seamless collaboration across diverse participants.



Founding member, Bureau

Sophie Hoehlinger
General Secretary

Sophie Hoehlinger is an executive with a rich educational background and extensive experience in the pharmaceutical and healthcare industries. She holds a European Board Diploma from ECODA and a Board of Director Certificate (climate and biodiversity option) from Sciences Po Paris, both obtained in 2024. Her academic journey began with a bachelor's in biology from Louis Pasteur University, and she has further honed her skills through executive programs at Vlerick Business School, INSEAD, IESE Business School.

Sophie's key strengths lie in P&L management, business strategy, digital transformation, and team empowerment. She is known for her collaborative leadership style, strategic finesse, and ability to simplify complex situations. Passionate about bridging tradition and innovation, Sophie is dedicated to driving long-term success through diversified human capital. As a biophile diver, Sophie considers the oceans as the most obvious ally of humankind.

Strategic committee, honorary member

Rutger de Graaf

Global and adaptation floating habitat solutions

Rutger de Graaf is an engineer and an entrepreneur who is recognized as the world's leading expert on resilient urban floating solutions. A Dutchman, he is, among other things, the founder of Blue21, a consulting and high-tech company fully specialized in the development and application of climate-proof floating building technologies for housing, energy, logistics and food production in social and ecological impact projects in the Netherlands and abroad.

He participated in the EU-funded project Space@Sea and was recently appointed to the Busan Marine Smart City Task Force, a UN-supported project. He contributes to build and use floating infrastructure as new engines for South Korea's growth and as powerful levers to address climate change.

Strategic committee, honorary member

Koen Olthius
"Aquatecture" or Floating Architecture

Koen Olthuis (1971), co-founder of the famous Dutch architecture firm Waterstudio, studied architecture and industrial design at Delft University of Technology. Waterstudio has a compelling expertise in floating urbanism and has been chosen to build the floating island of the Maldives , currently under construction.

In 2007, he was chosen as No. 122 on Time Magazine's list of the most influential people in the world due to the growing global interest in water developments. In addition, the French magazine Terra Eco chose him in 2011 as one of the 100 green people who will change the world.

Strategic committee, honorary member

Denis Lacroix

Ocean foresight

Denis Lacroix launched the prospective reflection at IFREMER in 2006 ((French Research Institute for Exploitation of the Sea). The collective work focuses on marine renewable energies, deep mineral resources, environmental scenarios for 2100, sea level rise, etc. Author and contributor of numerous books, he carries out training missions in foresight and strategic monitoring in 5 universities in France and Europe.

» The Indigo Civilization project is rich in visions for humans, as for nature, in close connection with the sea. Will we be able to replace the current military and economic thalassocracies with projects that value co-construction rather than competition, links rather than goods, trust rather than mistrust?

his project carries precisely the dynamics of a new alliance with the sea, so that this global common good also carries creative utopias. Young people also need a desirable future. Here is a concrete example: it invites us to take off. »

Strategic committee, honorary member

Morgan Rae

Marine-Based Designer | Regenerative Hospitality Pioneer

As an experienced guide to aquatic living, Morgan Ræ brings her decades of hospitality research to style the circular economy and deep-sea space. To elevate the standards of design and raise awareness of our water connection, L'eautelier is part-studio, part-host, mixed with the fluidity and resilience of its element of choice.

L'eautelier recently hosted the Dreams Do Come True Exposé during the 2022 UN Ocean Conference in Lisbon and was co-host of the I ♡ NY Sea water awareness series during the 2023 UN Water Conference.

Ræ's latest accolades include four design awards including #6 of the 2024 World's 50 Best Hotels for Royal Atlantis, and 2021 Radical Innovation. Ræ has also been featured on numerous podcasts including Seasteading Today and Top Floor, for her aquatic design. Having worked on over 100 projects worldwide, holding over 25 years of experience, she is one of the pioneers of the nomadic design studio concept.

Ræ has worked with recognized hotel brands, including Kerzner's Atlantis and One&Only Resorts, Nômade, SohoHouse & 1Hotels, Westin, Sheraton, 11Howard, Fairmount, Fontainebleau, Cosmopolitan Las Vegas, Hard Rock, MGM, Selina, and hospitality-focused residences such as BMW's Mini Living and aquatic companies like America's Cup and Royal Caribbean.

Current works include an algae-based bed & breakfast designed specifically for solo travellers wanting a digital detox.

Strategic committee, honorary member

Damien Serre

Resilience strategies and applied sciences

Damien Serre is Prof., Associate Researcher at UVSQ-CEARC (cearc.fr) and CEO of TheClimateSandards Company and RESCUESolutions. He is leading R&D projects in the area of resilience to climate risks with a special focus on resilience assessment, critical infrastructure management, spatial decision support systems to optimize resilience of different types of hazard with a strong expertise on floods.

He chaired or co-chaired many international tracks or session in his area of expertise e.g. the EGU General Assembly in Vienna in 2009, 2010, 2017 and 2018 as well as FLOODRISK 2016 International Conference in Lyon in 2016 (Disaster risk and recovery session). He was editor of the Journal of Water and Climate Change (IWA) 2013-2021, is editor of the journal Urban Risk Studies (ISTE) and member of the Editorial Board of the Journal of Flood Risk Management (Wiley).

Strategic committee, honorary member

Jack Dyer
Blue Economy & Finance Advisor

Dr Jack Dyer as a specialist climate change, development and blue/ocean economist, has over 10 years global/African consultancy, lecturing and entrepreneurship experience with a BSC Hons in Economics from the University of Kent, a Master of Commerce (Maritime Economics/Law) and PhD in climate change's impact on the future of Pacific and global blue economies/marine resources, ecosystems, communities and individuals.

His climate change, circular green and blue economy experience ranges from cruise and marine tourism to education, MSP, marine protected areas, natural disasters business, drones, ship repair, finance and psychology space economy, maritime law, ocean governance, logistics.

Dr Jack Dyer, has been involved in researching as an academic, researcher, lecturer, entrepreneur and consultant to improve the prospects in creating a sustainable and profitable; oceanic eco-conscious destiny for the future of the blue economy and Earth.

Strategic committee, honorary member

Simon Nummy

Sustainable design in constrained environments

Simon Nummy is a sustainable design consultant and architect with over 20 years of experience across large-scale commercial projects in Europe, Asia, Australia, and the Middle East. Specializing in sustainable design for transportation infrastructure, including metro systems, light rail, high-speed rail, bus networks, and marine projects.

Before joining NEOM, Simon spent over a decade in the Middle East working with 2oa.studio, ATKINS, and Mott MacDonald. Prior to that, he worked in Australia for HASSELL and COX Architects, contributing to a diverse range of projects, such as metro systems, sports stadia, industrial and research facilities, high-rise residential buildings, education campuses, and hospitality developments.

From 1995 to 1997, Simon worked with Ken Yeang in Kuala Lumpur, Malaysia, where he was involved in the concept design and development of bio-climatic high-rise and master planning projects. He was shortlisted for the LAGI 2014 competition with #HelioTweet and for LAGI 2019 with ANTHROPOCENE, which was exhibited at MASDAR. Simon also won the Seasteading Institute's 2015 competition with "Storm Makes Sense of Shelter", showcased at the V&A Museum in London as part of "The Future Starts Here: 100 Projects Shaping the World of Tomorrow."

Strategic committee, honorary member

César Jung-Harada

Ocean multidisciplinary impact innovation

Cesar Jung - Harada is a French - Japanese designer, environmentalist, educator, and entrepreneur, passionate about ocean technology, impact innovation, and education based in Singapore.

Cesar is an Associate Professor of Design at the Singapore Institute of Technology and is currently a candidate Ph.D. in Design and Ocean Innovation at the CNAM (France), Director of MakerBay LTD (Hong Kong Makerspace), Scoutbots LTD (Ocean Robotic Startup). Cesar serves as a Trustee of the board of HBKU (Qatar), the Wyng Foundation (Hong Kong).

Cesar was a Researcher and Project Leader at MIT, and holds a master degree from the Royal College of Art (Design Interactions), and another Master Degree from the ENSAD Paris (Animation). Cesar regularly delivers workshops and keynotes at international conferences in places such as the UN, Harvard or TED. Lately Cesar has organised an exhibition in Singapore of his project of International Ocean Research Station.

Strategic committee, honorary member

César Ducruet

Transport, ports and logistics

César Ducruet, geographer, is senior researcher at the French National Centre for Scientific Research (CNRS). He is currently working at the EconomiX laboratory (Paris-Nanterre) on the local impact of contemporary maritime globalization. His research focuses on technological innovation, connectivity, employment, vulnerability, environment, and health issues in a port and port-city context. He is principal investigator of the ANR-funded research project "Maritime Globalization, Network Externalities and Transport Impacts on Cities" (MAGNETICS) (2023-2026).

César has been expert for various international organizations (OECD, World Bank, WHO) and works regularly with numerous partners in Asia (Korea Maritime Institute, JETRO, ASEM, Chinese Academy of Sciences, ECNU, Fudan University, Shanghai Maritime University). His publications include three edited volumes on Maritime Networks (2015), Shipping Data Analysis (2017), and Port Systems (2023) in the Routledge Studies in Transport Analysis. Two additional volumes are under preparation: “Port-Cities and Globalization since the 1950s” and “Healthy Port Cities: Mitigating Environment and Public Health Impacts of Ports and Shipping” (2025-2026).

He is also associate member of porteconomics.eu, scientific board member of SFLOG, GIS Axe Seine, GDR OMER, RETE Association, international advisory board member of PortCityFutures, and editorial board member of Journal of Transport Geography, Maritime Business Review, International Journal of Transport Economics, and Portus.

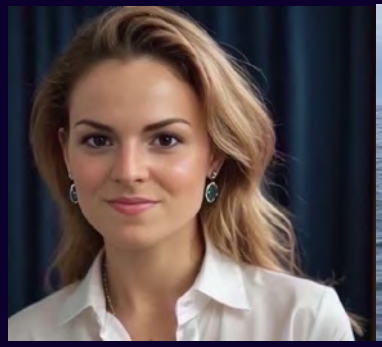
Our Heart patron

Emma-Claire Fierce

Artist, explorer and top athlete, Emma-Claire embodies the values of creativity, generosity, integrity and audacity advocated by The Indigo Civilization. She is the first French woman to swim across the Oceans7, a marathon swimming challenge consisting of seven iconic open water channel crossings.

Known for her outstanding contributions to extreme swimming and sports science, she has been officially recognized as an Ocean Expert by UNESCO. This prestigious recognition highlights her expertise in ocean studies and her commitment to advancing the scientific understanding of human adaptation to extreme environments.

“The Indigo Civilization is not a project—it is more. It is beyond us all. It is a cultural and civilizational positive construction grounded in the values of unity, creativity, beauty, inclusion and transformation across nations and generations. It envisions a harmonious collaboration with the oceans and the richness of our biology”.



Youth Lead Ambassador

Lucca Stevenson

Lucca Gianni Figueiredo Stevenson is an International Relations graduate from PUC-SP with a focus on climate governance, global markets, and sustainable finance. He is the founder of Abaixando a Maré, an initiative dedicated to addressing the economic and policy impacts of rising sea level through climate adaptation and international cooperation. Lucca has spoken at COP30 and engaged with Brazil's Ministry of Climate on policy recommendations related to sea level rise and coastal adaptation.

He has professional experience at the France–Brazil Chamber of Commerce, where he contributed to investment-oriented country reports, policy briefs, and high-level international engagements. He speaks Portuguese, English, French, and Spanish.

Partnerships manager

Fabian Baumgaertner

Growing up in landlocked Bavaria, Fabian Baumgaertner fell in love with water when learning swimming at the age of 4 and joined lifeguard training while still a child. This was followed by working in a swim school and freediving while studying in Vienna, eventually leading to his roles as a Scuba Dive Master, Freediving Instructor, and an MSc in Ocean Science. His love for the sea was fueled by unforgettable experiences as a crewmember on an Atlantic crossing and on an educational vessel for the summer season in the French Mediterranean.

As the currents of his professional journey navigated him from political science to the depths of the ocean, He's driven to make a lasting impact towards healthier oceans. His journey intertwines climate policy, environmental NGOs, youth work and ambition to create meaningful change. Fabian feels a very strong connection to freedivers (human or not) and a particularly deep fascination with humpback and sperm whales.

More and more, life at sea is emerging as a viable, if not necessary, solution for residents of coastal areas and small islands threatened by rising sea levels. Beyond the necessities of climate adaptation, this step out to sea holds enormous opportunity for humanity to act as ecosystem engineers for once that bring positive environmental impact to the ocean.

APPENDIX 2

CONTEXTUAL INFORMATION ABOUT BORA BORA & FRENCH POLYNESIA

PRELIMINARY DATA FROM SHOM

Indigo Civilization
the ocean dwellers

Challenges and assets of French Polynesia

Key challenges

Demographic slowdown and cultural resilience:
decrease in births and emigration of young people/talents.
(20% of 18-25 left the territory, in 5 years – ISPF, 2022)

Sustainable tourism transition:
reconciling ecological and socio-economic interests.

Structural trade deficit.

Energy, food and tourism dependence.

Carbon footprint / inhabitant:
60% higher than the world average.

Pollution and immediate environmental challenges:

- Degradation of terrestrial and marine ecosystems,
- Loss of biodiversity.

In 2100, 1/3 of the 118 islands of Polynesia would be uninhabitable due to rising sea level (French CSE – 2025).

Key assets

Positive economic conditions(cf. IEOM 2024 report):
growth, inflation control and employment dynamism.

Profitable high-end touristic economy (+13% in, 2024).

Exceptional development potential conducive to the development of a blue economy whose current weight remains low:

- Environmental heritage,
- Vast maritime area (48% of the French EEZ),
- Diversity of natural resources.

Potentials of an offshore ecosystem-based blue economy (cf. Innovation Strategy 2030) :

- Eco-cultural tourism,
- Green logistics hub,
- Aquaculture,
- Marine renewable energies,
- Biotechnology,
- Research.

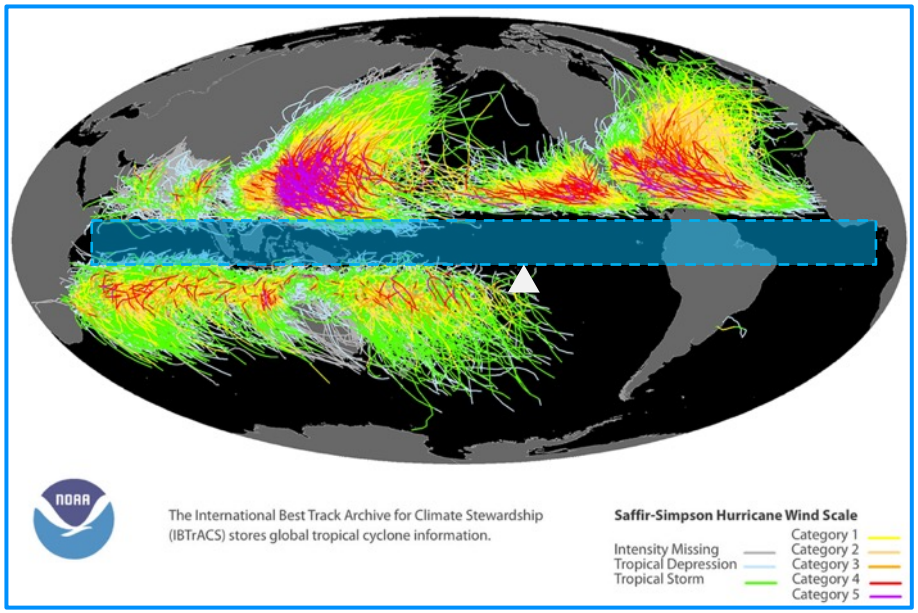
Making Polynesia a space for innovation

Synergies with the 2030 Innovation strategy published in May 2022

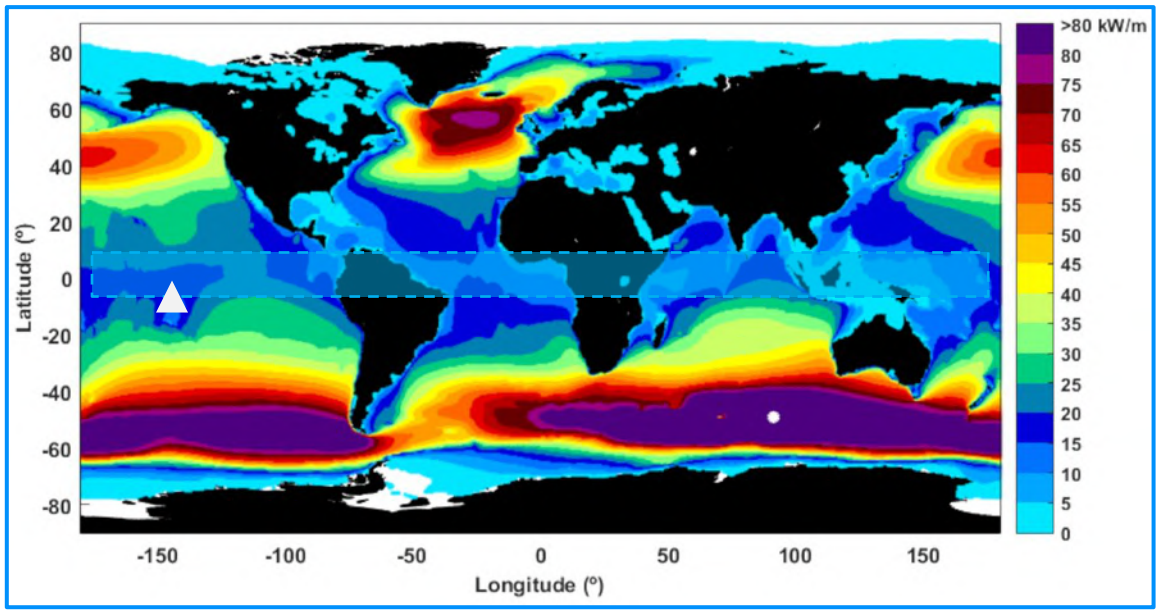
Activities	Priorities of the Polynesian Blue Economy strategy	Synergies Smart Offshore Ecosystem (/5)
Environment	Tackling marine pollution	3
	Monitoring, protecting and defending MPAs to preserve biodiversity	3
	Limiting anthropogenic pressures on coasts and reefs	5
Transport	Initiating the energy-efficient transition to alternative propulsion energies	4
	Encouraging the development of an eco-responsible shipbuilding industry	2
Aquaculture	Becoming a global benchmark in aquaculture	5
	Developing an offshore multi-trophic aquaculture sector	5
	Promoting artisanal aquaculture and fishing	3
Tourism	Be a model of eco-responsible tourism	5
	Becoming a showcase for cultural tourism	4
Logistics	Developing the attractiveness of Papeete's port	1
	Making Polynesia a decarbonized and sustainable logistics hub in the Pacific Ocean	1
Marine Energies	Developing MRE demonstrators to move towards energy autonomy	5
	Generate a trade surplus (electricity, H_2)	4
R&D	Strengthening a sector of excellence to better understand the ocean	4
	Be a major source of biotechnology valorisation	5
	Becoming a pilot territory for the bioeconomy	5

BORA BORA, A FAVOURABLE EXPERIMENTATION AREA

Calm waters and favourable weather conditions to maximize viability and reliability and minimize risk and cost.
The cyclone risk in French Polynesia is almost zero in normal years, more important during El Nino years, with cyclones remaining confined to the west of the South Pacific and the Indian Ocean.



Tropical cyclone tracks since 1842 – NOAA data base



30-year average wave power (1989-2018) – ERA5 database

Particularly favourable theoretical experimentation area

APPENDIX 5

PANEL OF OFFSHORE INFRASTRUCTURES AND PROJECTS,

NONE IS A SMART OFFSHORE ECOSYSTEM

Indigo Civilization

the ocean dwellers

OBJECTIVES : RESILIENCE & ADAPTATION

To escape environmental threats or invasions, people around the world have learned to live on water: the Bajau and the Moken in Southeast Asia, the Sama-Bajau in East Africa, the Malaita people in Oceania, the Uros in South America, the Venetians from the 5th century onwards, or more recently, the Dutch in Europe. They have adapted brilliantly with low-tech solutions available at the time to build resilient aquatic infrastructures: kelong, pile dwelling, lake city, etc.

OBJECTIVES : MISCELLANEOUS WORK

Between 2 and 3 million workers live at sea, offshore and at least half of the year, on mobile or fixed infrastructure: fishery, naval force, merchant navy, oil & gas platforms, cruise ships

OBJECTIVE: SURVEILLANCE

13 km from the British coast, the Maunsell Forts were built in 1942 to guard the Thames estuary against enemy invasion. Abandoned by the British army since the late 1950s, this infrastructure has still been in place for more than 80 years. Up to more than 2,000 people lived simultaneously on these maritime installations.

❌ Single-functional infrastructure
✅ Resilient offshore infrastructure

OBJECTIVE: OCEANOGRAPHIC RESEARCH

16 km off the coast of Venice, the Acqua Alta Oceanographic Tower has been measuring waves and tides in the Adriatic Sea for 45 years.

http://www.deos.tudelft.nl/ers/tower.html

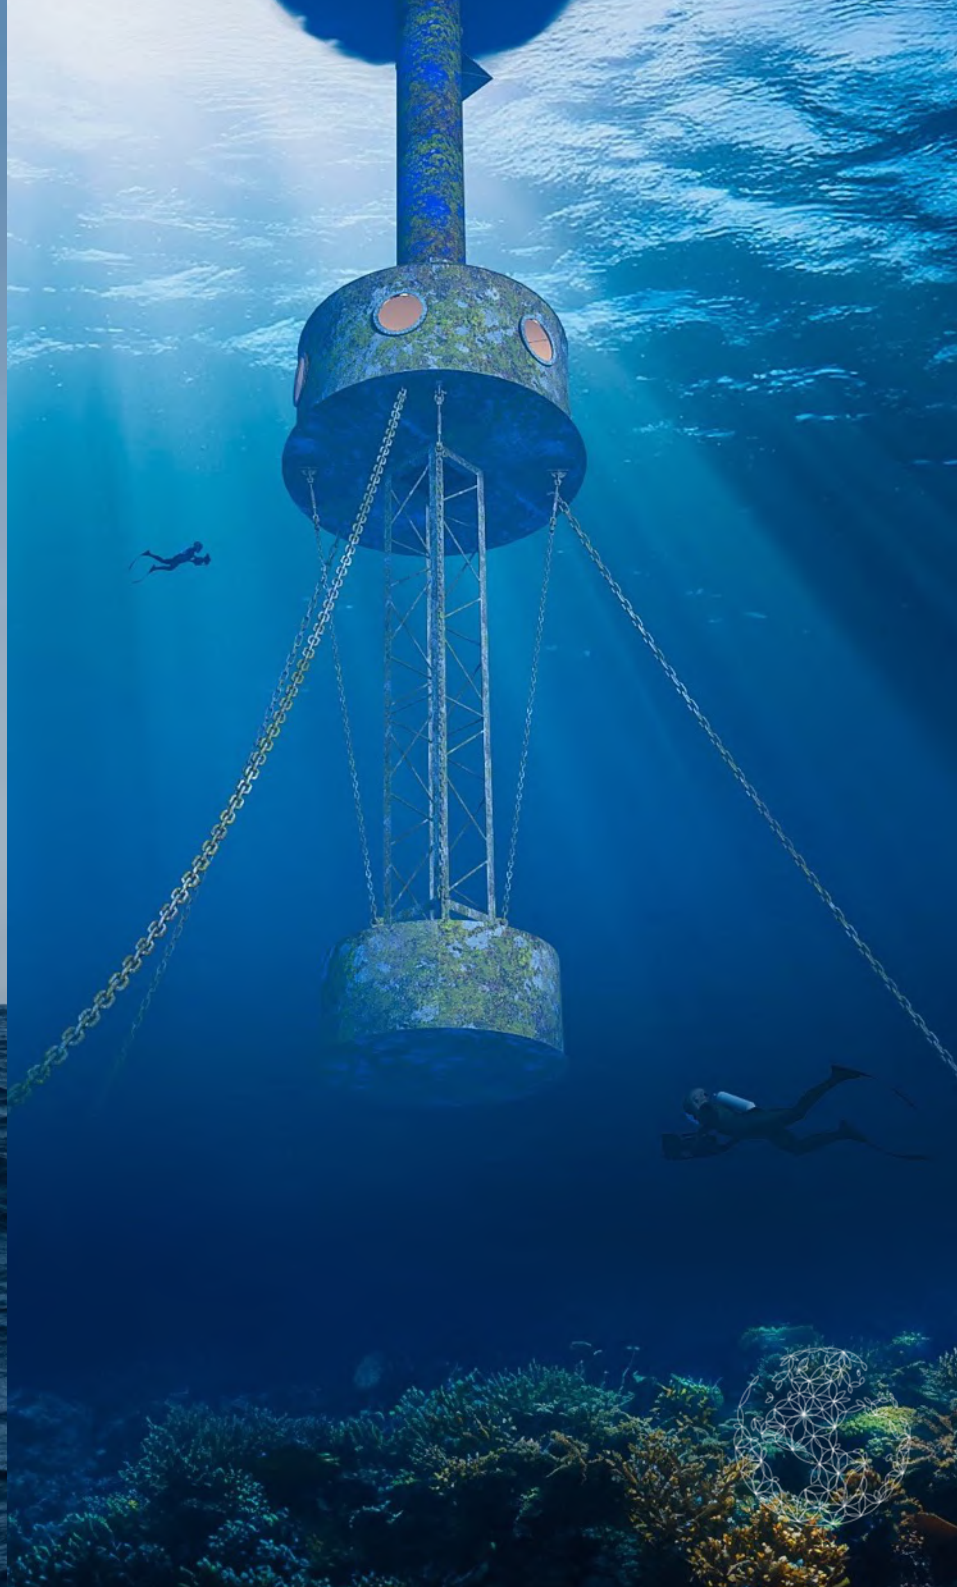
❌ Shallow Monofunctional Infrastructure (16m)
✅ Resilient offshore infrastructure

OBJECTIVE: INDIVIDUAL TEMPORARY HABITAT

In Panama, Ocean Builders creates and experiments eco-friendly high-tech floating homes (depth from 20 to 200m). Life above the waves: « at Ocean Builders we believe that true caring for the oceans requires one to actually live there ».

https://oceanbuilders.com

❌ High-end real estate project above all, limited local positive impact
✅ Small, biophilic smart offshore infrastructure



OBJECTIVE: RESILIENCE AND ADAPTATION, INCLUSIVE HABITAT

In March 2021, the Maldives formalized the start of construction of a modular floating city in the centre of an atoll. This country of 2000 islands having an average altitude of 2m is threatened by the inevitable sea level rise.

Delivery: from 2027
https://maldivesfloatingcity.com/

❌ Not self-sufficient in energy and food, waste management?
✅ Climate change adaptation habitat, integrated design

Crédit photo : Dutch Docklands / Waterstudio

OBJECTIVE: MULTIDISCIPLINARY RESEARCH

In the Canary Islands, PLOCAN project aims to become a world-class testbed that helps accelerate the development of technologies and knowledge to conserve, regenerate and use marine renewable resources in an efficient and sustainable way, ensuring equitable prosperity for users and effective environmental protection.

https://plocan.eu/en

❌ Grounded infrastructure incompatible with great depths, non-biophilic
✅ Very interesting Atlantic Maritime Future Laboratory

OBJECTIVE: ECO-TOURISM

In Malaysia, Seaventures Dive has converted an oil rig for scuba diving activities. Disused platforms become rich artificial reefs, conducive to eco-responsible aquatic tourism: upcycling of existing infrastructures and qualitative economic activities of eco-tourism. Around 15,000 offshore platforms have been identified in the world...

https://seaventuresdive.com

❌ Single-use and ugly infrastructure
✅ Reconditioning of relevant platform into artificial reef

OBJECTIVE: FOOD PRODUCTION

SalMar, a major player in global aquaculture, is testing an offshore Smart Fish Farm in Norway, 8 kilometres from the coast. The company aims to create the world's most reliable and intelligent offshore farming operations, with the highest fish welfare requirements and a zero-emission value chain ambition.

Under testing
https://salmarakerocean.no

❌ Single-use (fish farming), industrial design
✅ Infrastructure resistant to one of the most dangerous seas

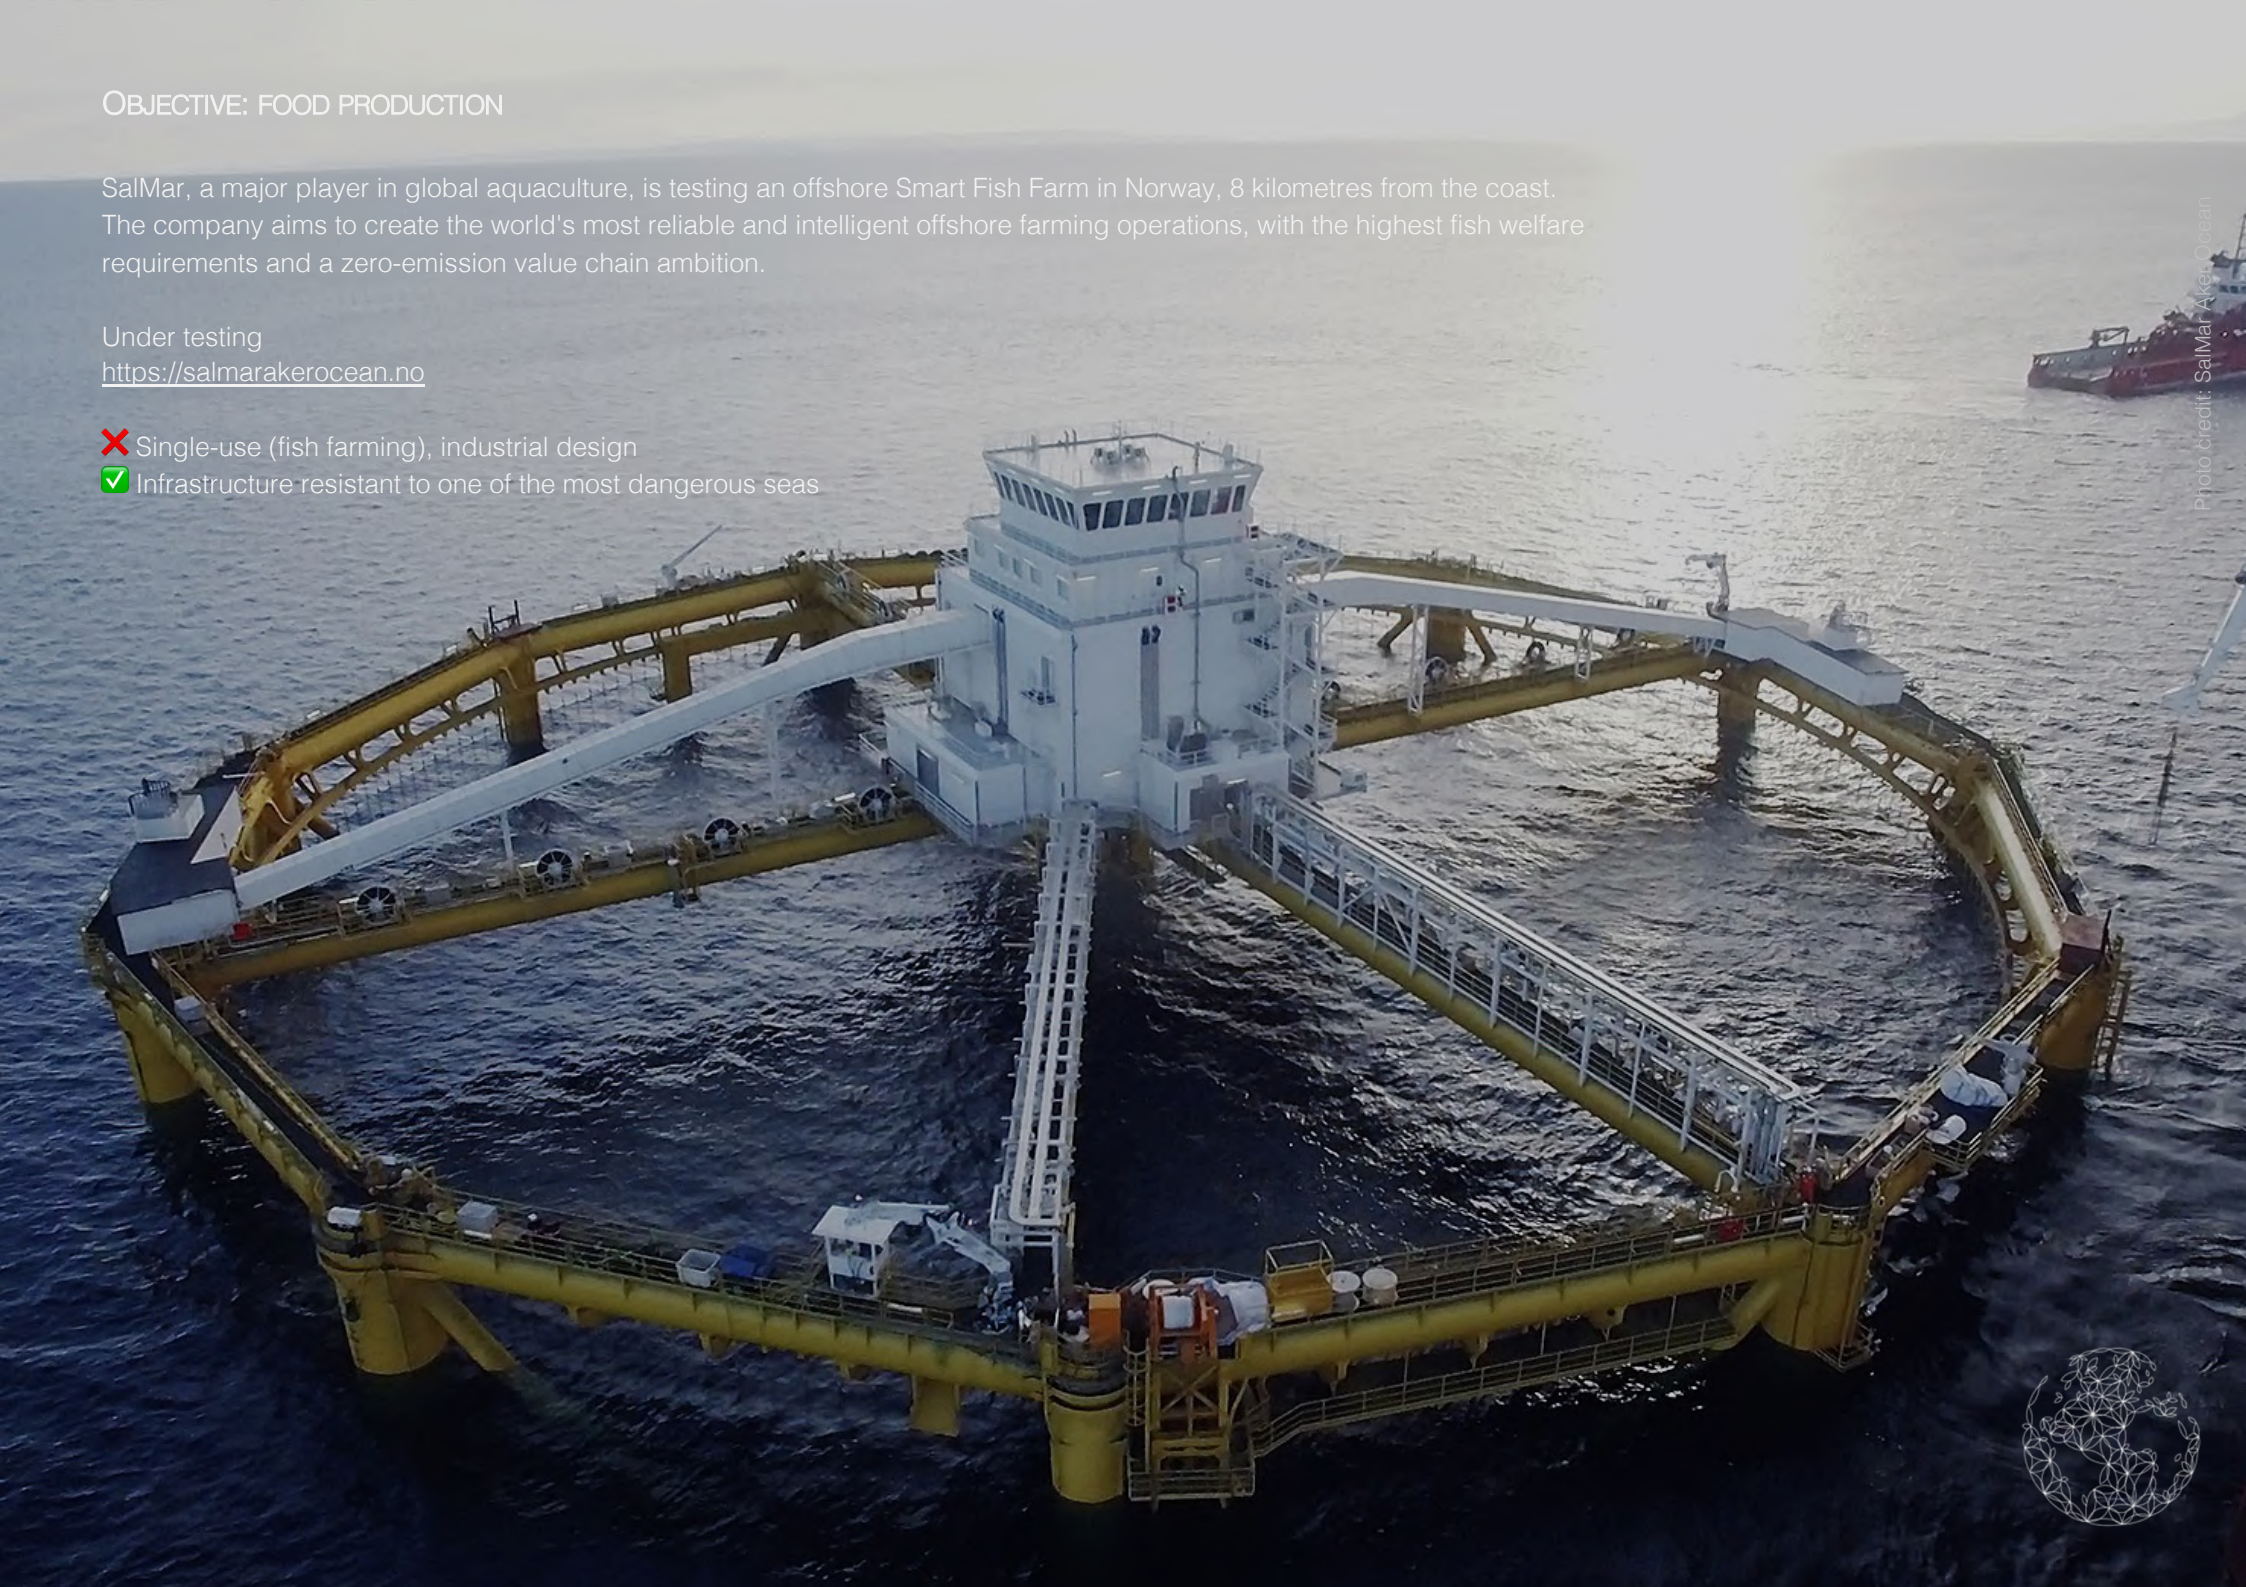


Photo credit: SalMar Aker Ocean

OBJECTIVE: OFFSHORE FISH FARMING

Mariculture Systems aims to become the first company to install a large offshore fish farm off the coast of Portugal in March 2026, from a semi-submersible platform. The first farm, approved by the Portuguese authorities, will grow sea bass and sea bream and will be located about 15 kilometres off the southern Algarve region of Portugal.

https://www.mariculture-systems.com

❌ Single-functional infrastructure
✅ Resilient offshore infrastructure

Photo credit: Elia

OBJECTIVE: PRODUCTION OF RENEWABLE ENERGIES

The Princess Elisabeth Island will be located almost 45 km off the Belgian coast and will be an extension of the electricity grid in the North Sea. It will connect wind farms from the sea to the mainland and create new connections with neighbouring countries.

Delivery : 2030
https://www.elia.be

❌ Single-use (energy) and non-biophilic industrial project
✅ Infrastructure resistant to one of the most dangerous seas

OBJECTIVE: PRODUCTION OF RENEWABLE ENERGIES

From 2030, Vindø will be the world's first floating artificial island to produce renewable hydrogen from offshore wind power on a large scale. Located a hundred kilometres from the coast, this 120,000 m2 structure will be close, in logistical terms, to offshore oil.

Delivery : 2030
https://www.windisland.dk

❌ Single-use (energy) and non-biophilic industrial project
✅ Open tough sea resilient infrastructure, human worker ecosystem

Photo credit: Vindø

PRIORITY OBJECTIVE: ECO-TOURISM

Dubai Reefs is a floating living laboratory project for supposed marine restoration and especially ecotourism.
The project aims to create more than 30,000 jobs in a green economy.

Delivery : 2030
https://urb.ae/projects/dubaireefs/

❌ Tourist vocation above all, real coastal ecological impact vs. anthropogenic activities?
✅ Biophilic project, non-invasive and floating infrastructure

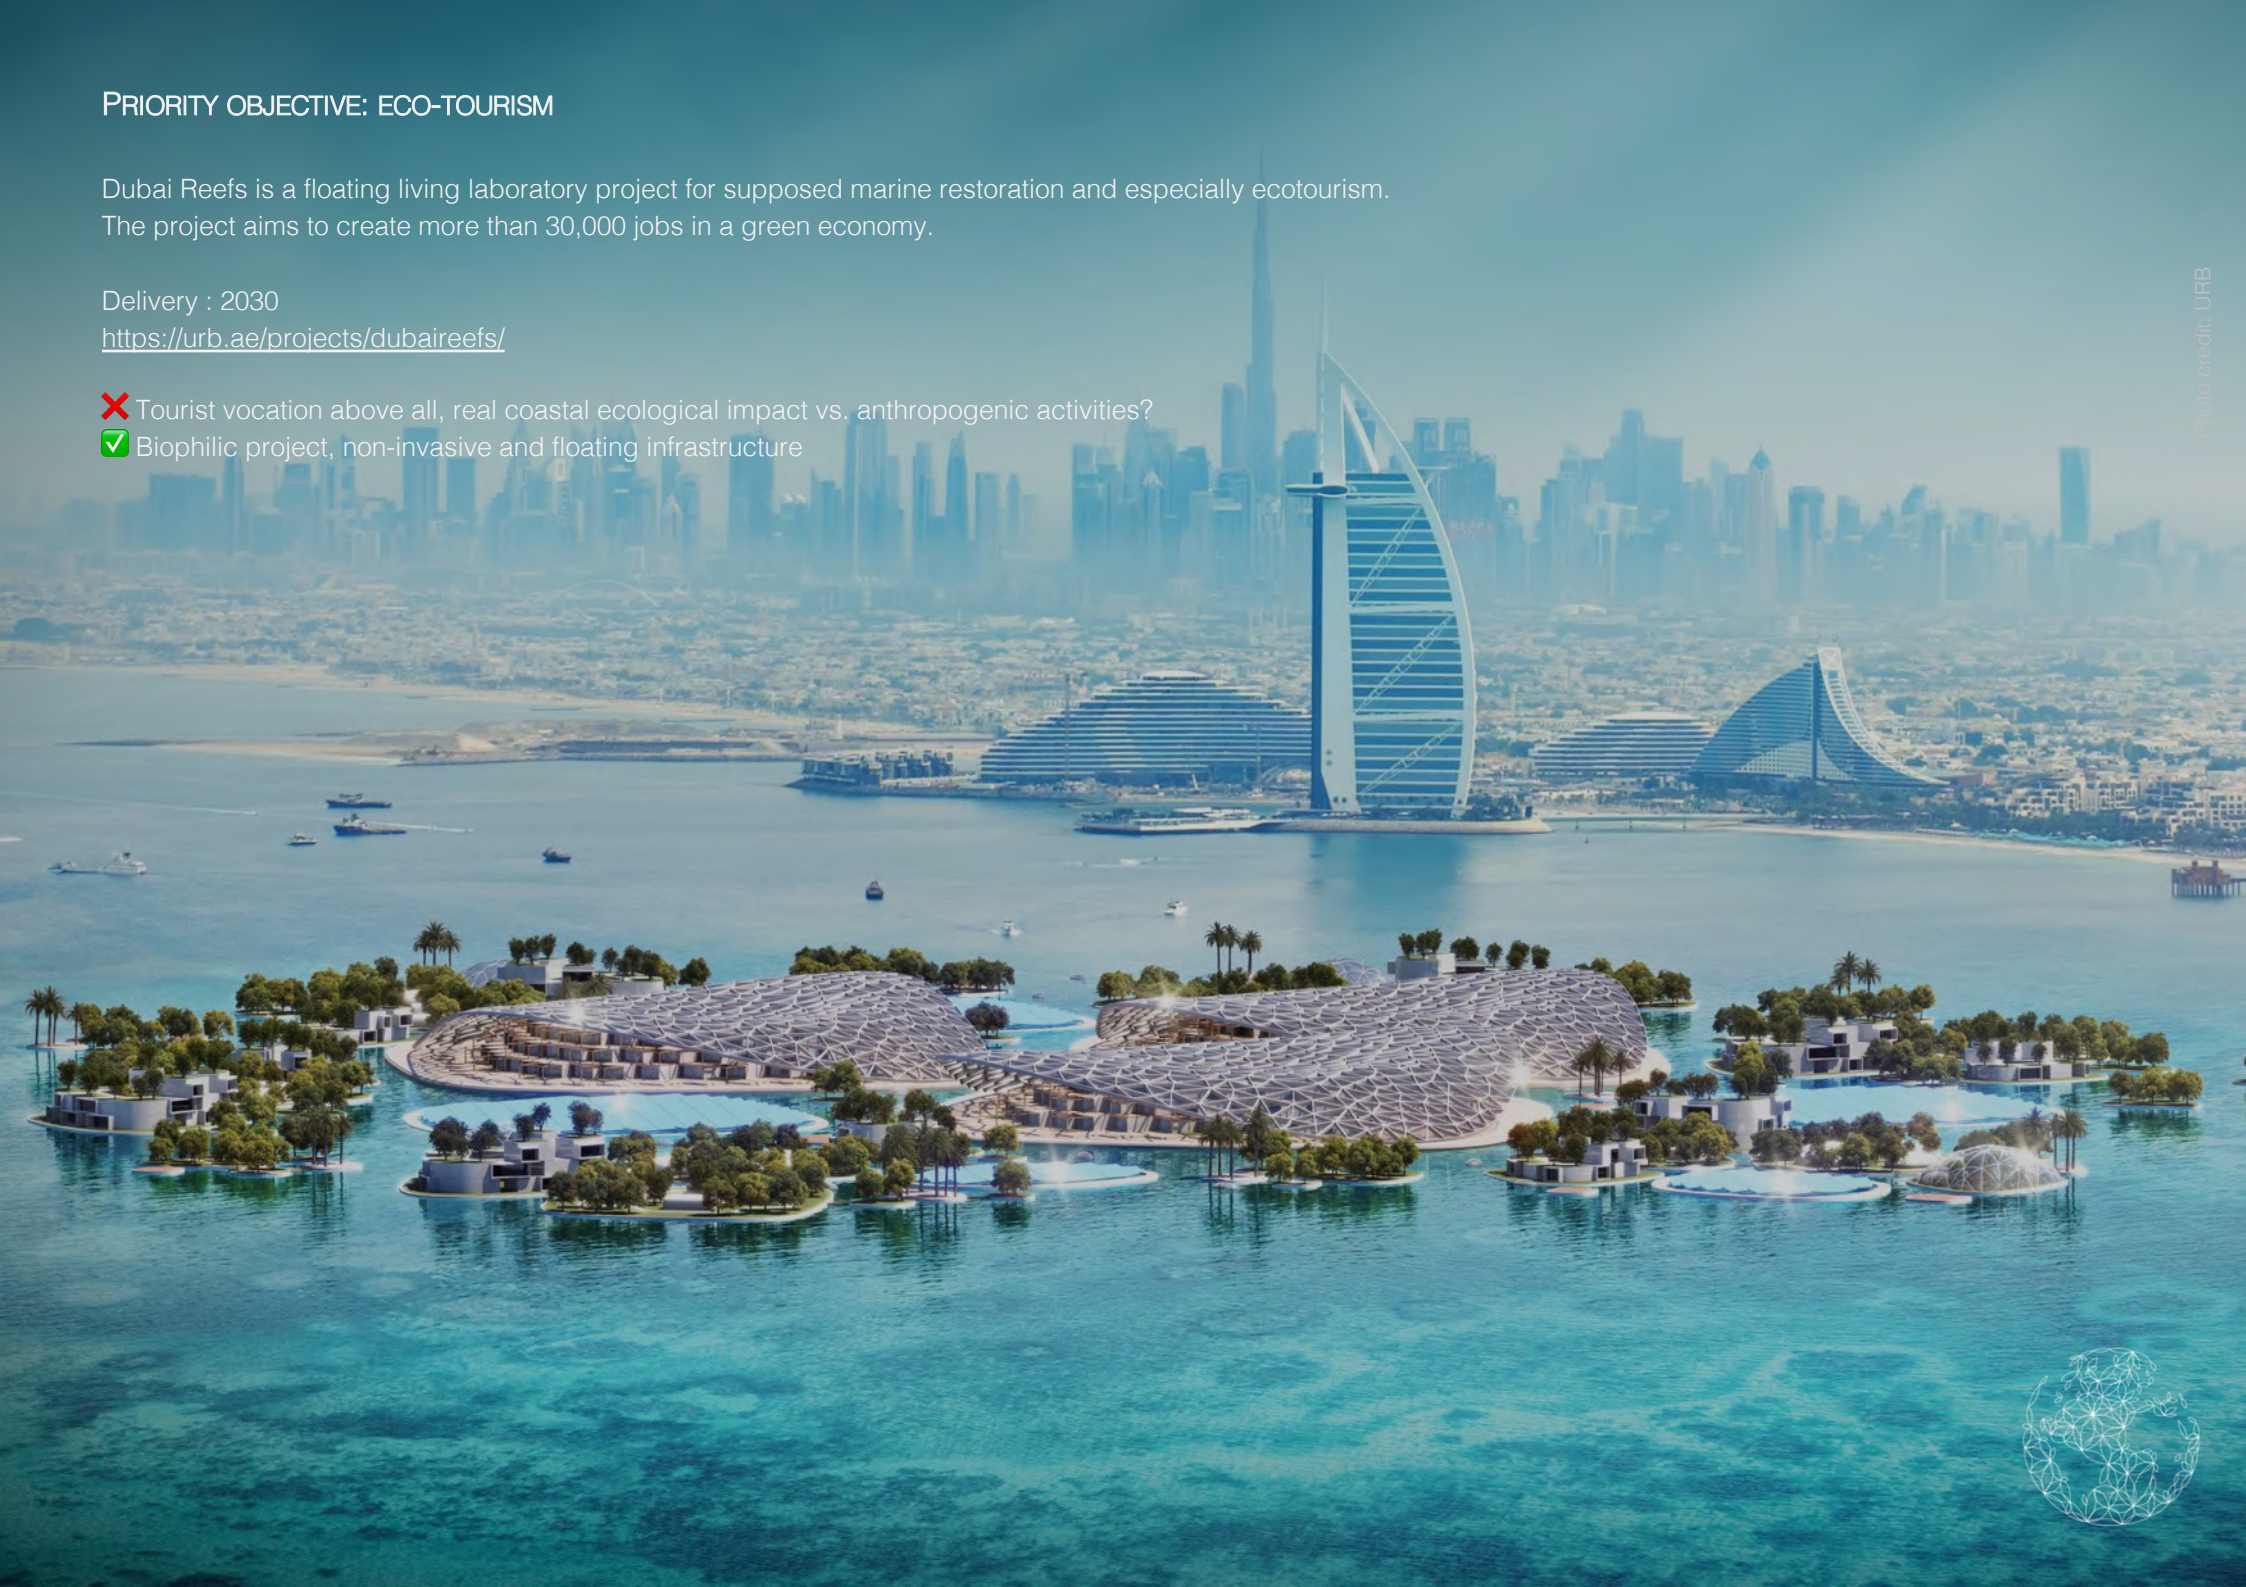

Photo credit: URB

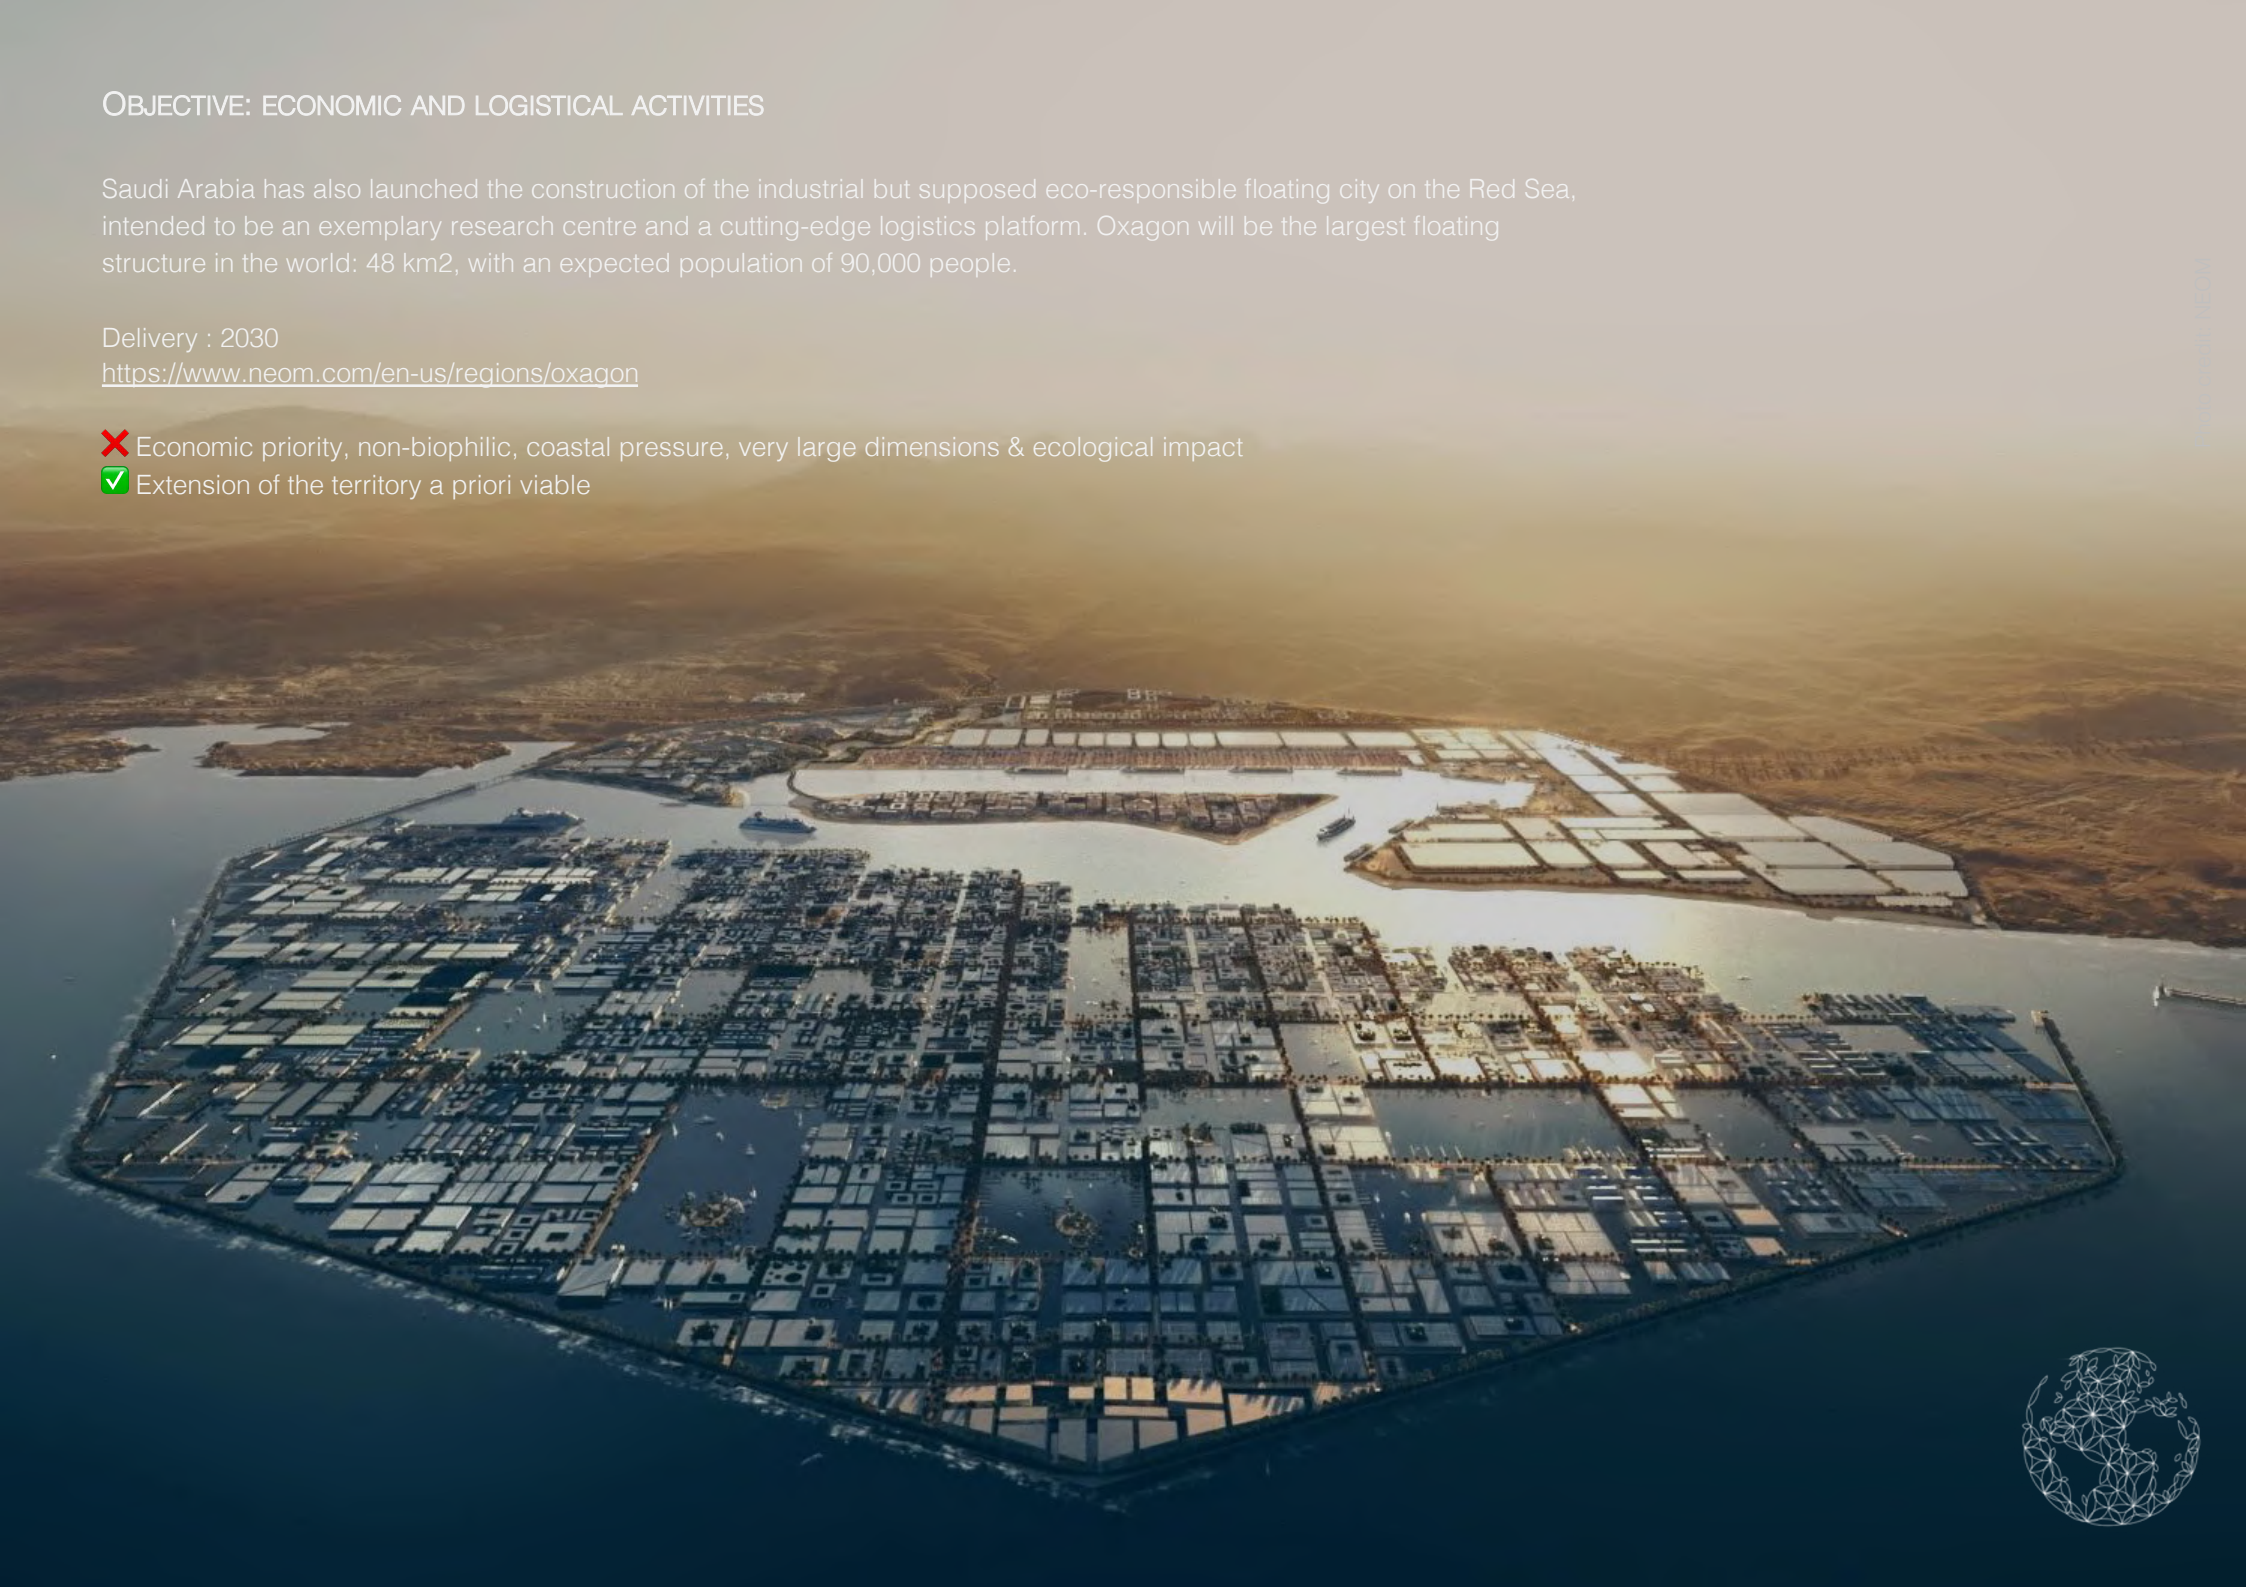
OBJECTIVE: ECONOMIC AND LOGISTICAL ACTIVITIES

Saudi Arabia has also launched the construction of the industrial but supposed eco-responsible floating city on the Red Sea, intended to be an exemplary research centre and a cutting-edge logistics platform. Oxagon will be the largest floating structure in the world: 48 km2, with an expected population of 90,000 people.

Delivery : 2030
https://www.neom.com/en-us/regions/oxagon

❌ Economic priority, non-biophilic, coastal pressure, very large dimensions & ecological impact
✅ Extension of the territory a priori viable

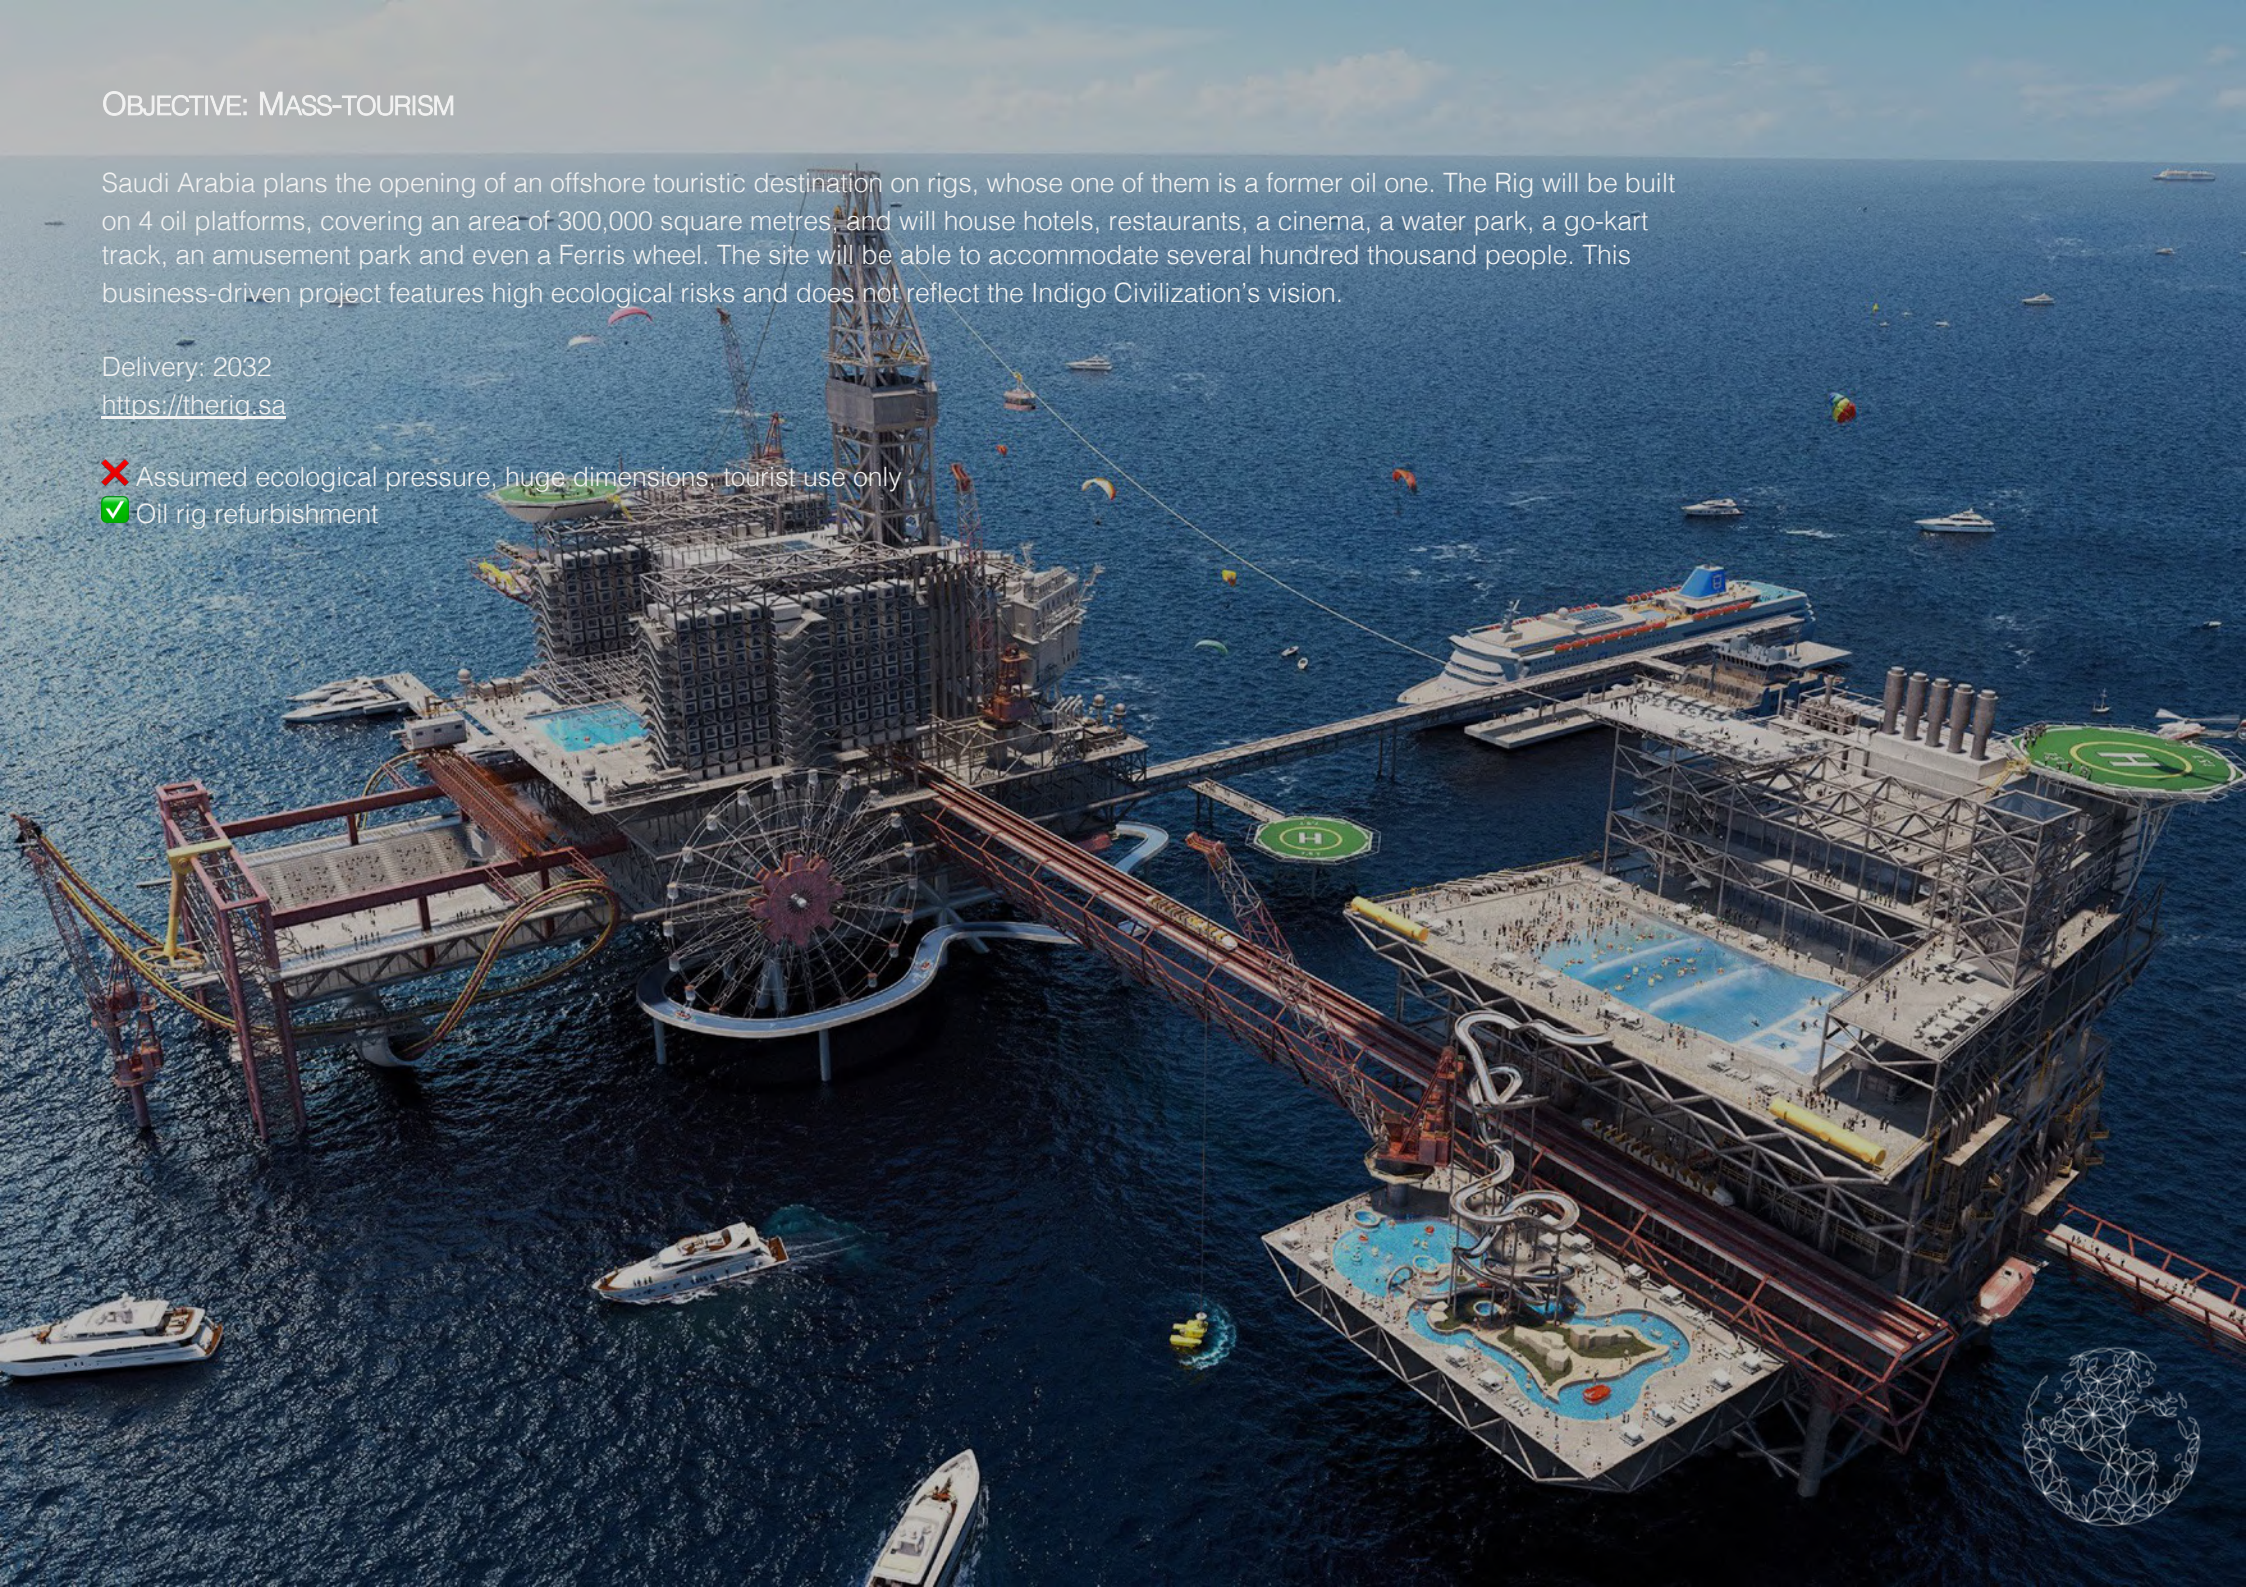


OBJECTIVE: MASS-TOURISM

Saudi Arabia plans the opening of an offshore touristic destination on rigs, whose one of them is a former oil one. The Rig will be built on 4 oil platforms, covering an area of 300,000 square metres, and will house hotels, restaurants, a cinema, a water park, a go-kart track, an amusement park and even a Ferris wheel. The site will be able to accommodate several hundred thousand people. This business-driven project features high ecological risks and does not reflect the Indigo Civilization's vision.

Delivery: 2032
https://therig.sa

❌ Assumed ecological pressure, huge dimensions, tourist use only
✅ Oil rig refurbishment



APPENDIX 6

ABOUT TENSION-LEG PLATFORMS

Indigo Civilization
the ocean dwellers

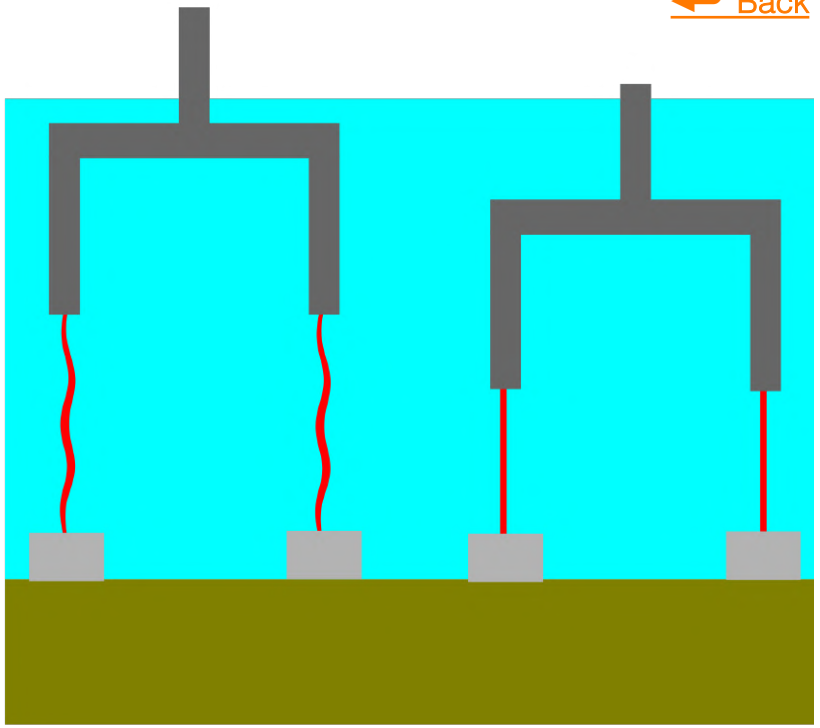
TENSION-LEG PLATFORM

SAFETY, STABILITY AND COMFORT IN DEEPWATER

Back

A tension-leg platform (TLP) or extended tension leg platform (ETLP) is a type of fixed marine structure, used for many oil platforms but also studied in the context of floating offshore wind turbines. Such a platform is connected to the seafloor by stretched steel cables. It is particularly suited for water depths greater than 300 metres (about 1000 ft) and less than 1500 metres (about 4900 ft). In the case of the Mangolia platform in the Gulf of Mexico, the water depth is 1,432 meters above the platform.

The platform is permanently moored by means of tethers or tendons grouped at each of the structure's corners. A group of tethers is called a tension leg. Having a high axial stiffness (low elasticity), tension legs keep he structure deeper in the water than its natural waterline — in other words, the platform has excess buoyancy. Virtually all vertical motion of the platform is eliminated.



Source: Wikipedia

Illustration of a tension leg mooring for a floating platform

Left-hand side: free-floating, cables (red) not under tension

Right-hand side: cables have been tensioned ballasted floating structure (grey) underwater cables (red) connect seabed anchors (light grey) with lower legs

Appendix 7

Aiming for agile technology to gain energy self-sufficiency (OTEC)

Indigo Civilization
the ocean dwellers

Energy self-sufficiency of small islands

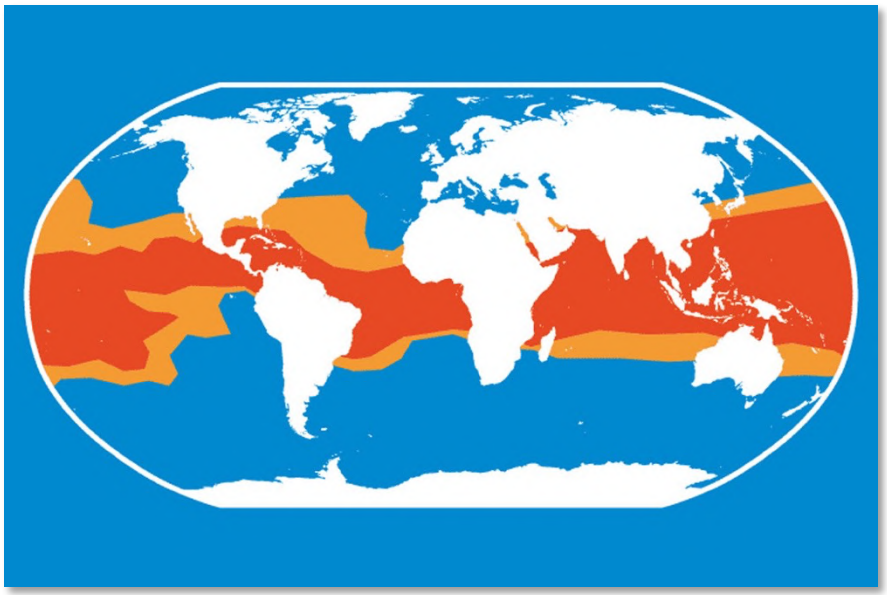
Agile, compact, modular and load-bearing OTEC technology

Back

To supply an SOE that is also used for tourism and can accommodate a hundred guests, we estimate an **annual energy requirement of about 1,400 MWh**. This estimate is based on an average consumption of 50 kWh per room per day, which is typical for a luxury hotel (including air conditioning, heating, lighting, electronic equipment, swimming pool, spa, restaurants, etc.).

To achieve the self-sufficiency of such an SOE, it would be necessary to deploy an integrated **OTEC unit delivering a net power of at least 180 KW** with a load factor of 90%, which seems realistic compared to the project of an onshore OTEC unit in Bora Bora (SWEET2), whose power envisaged would be 1.2 MW (covering 20% of the needs of the entire island).

Our project aims to make the efficiency and viability of small, compact, agile, modular and extremely resistant OTEC offshore units viable to meet the self-sufficiency needs of small island and coastal territories present in the red zone of the graph opposite.



Source: Global OTEC

APPENDIX 8

ESTIMATED BUDGET – PHASE 2

Indigo Civilization
the ocean dwellers

PHASE 2 : ESTIMATED BUDGET

2,88 M€ OVER 36 MONTHS

Back

PROVISIONAL BUDGET	YEAR 1	YEAR 2	YEAR 3	SUB-TOTAL
Team meetings	20 000 €	20 000 €	30 000 €	70 000 €

APPENDIX 9

ECONOMIC AND FINANCIAL PRE-EVALUATION

Indigo Civilization
the ocean dwellers

A VIABLE AND ATTRACTIVE PROJECT

INVESTMENT AND MAINTENANCE FINANCED BY A SHARED BUSINESS MODEL

Back

Assumptions

Initial investment: 100 million euros.

Average income per tourist: €10,500/week.
Capacity: 72 tourists/week (3,744 tourists/year).
Average occupancy rate: 60% (i.e. ~2,246 tourists/year).

Annual tourism revenue: €23.58 million (€2,246 × €10,500).
Additional income:

- Co-products: €3 million/year.
- Rental of space: 1 million euros/year.
- Subsidies and carbon credits: €2 million/year.

Total annual revenues: €29.58 million.

Annual operating costs: 15 million euros.
Discount rate: 5%.

Année	Revenues (M€)	Costs (M€)	Net Flow (M€)	Updated Flow (M€)	Cumulative Flow (M€)
0	-100	0	-100	-100	-100
1	29,58	15	14,58	13,89	-86,11
2	29,58	15	14,58	13,23	-72,88
3	29,58	15	14,58	12,6	-60,28
4	29,58	15	14,58	12	-48,28
5	29,58	15	14,58	11,43	-36,85
6	29,58	15	14,58	10,89	-25,96
7	29,58	15	14,58	10,37	-15,59
8	29,58	15	14,58	9,88	-5,71
9	**29,58**	**15**	**14,58**	**9,41**	**3,7**
10	29,58	15	14,58	8,96	12,66

Positive Net Present Value of €12.66 million over 10 years
Internal Rate of Return of approximately 6%, above the cost of capital
Profitability achieved in 8 years

APPENDIX 10

ILLUSTRATIVE EXAMPLES OF THE REGENERATIVE TOURIST EXPERIENCE

Indigo Civilization
the ocean dwellers

World's unique tourism experience

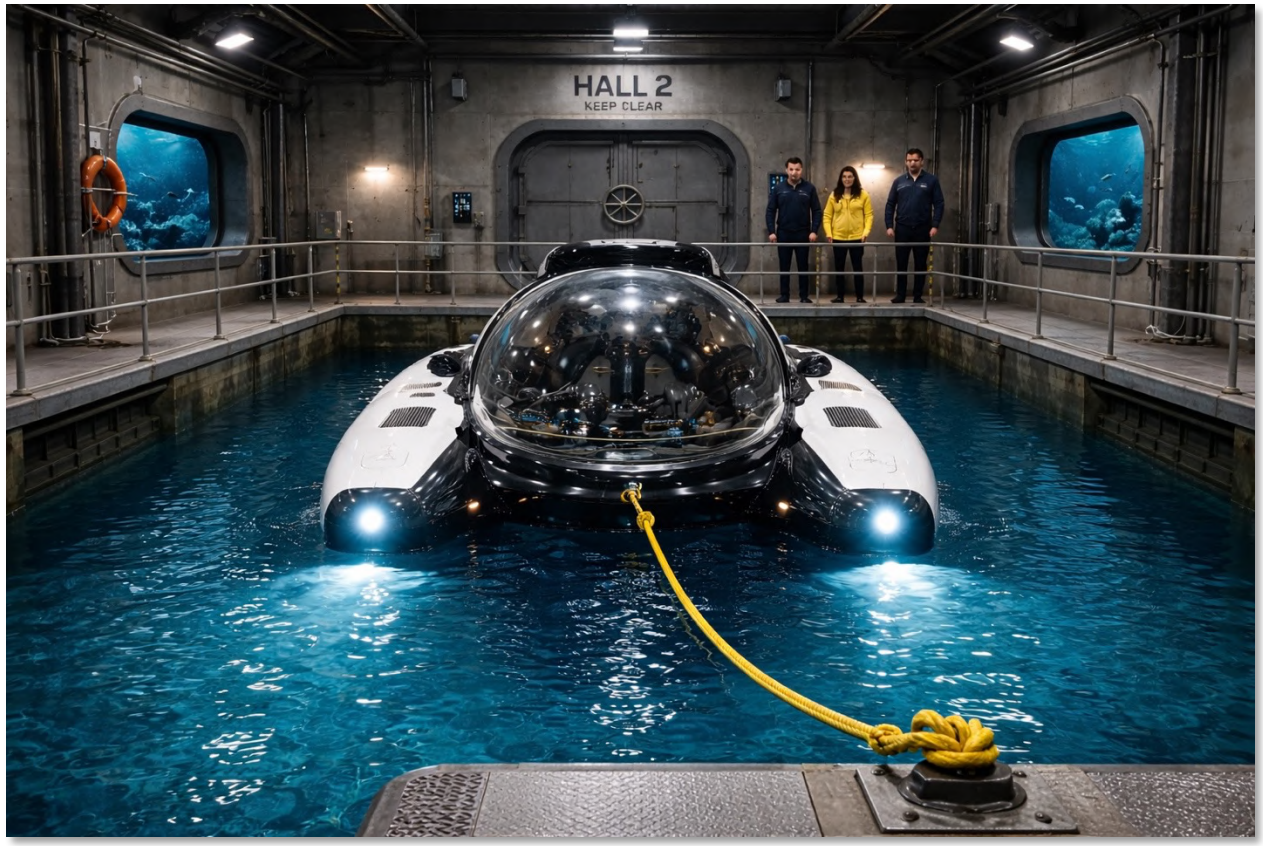
An immersive marine experience to support progress

An exciting high-end offshore resort (36 rooms) as a living laboratory combining avant-garde technologies and traditional knowledge to demonstrate is realistic to adapt and live well on water within regenerative, self-sufficient, safe and viable infrastructures.

Daily accommodation capacity: 72 ind. / Overall spare-time daily workers: 50 ind.

Immersive underwater experience

Experience Nemo's world



Discover the wonderful pelagic marine world and the great depths in a safe but immersive way thanks to a tourism submarine integrated into the SOE (cf. U-boat Worx Nexus).

« SLOW TOURISM »

BECOMING ONE WITH THE AQUATIC WORLD

Enjoy the benefits of nutrient-rich cosmetics from the depths and the spa,
and enjoy innovative gastronomy from local products.

WORLD'S UNIQUE ECO-SCIENTIFIC EXPERIENCE

A LIVING LABORATORY TO EXPERIMENT AND DEMOCRATISE REALISTIC AND SUSTAINABLE SOLUTIONS

Testing and making viable replicable solutions that on a larger scale would allow vulnerable island and coastal communities to adapt and live on the sea, in harmony and in a self-sufficient way.
In collaboration with scientists and searchers, guests are invited to learn, contribute and become true ambassadors of our initiative.

Inclusive educational tourism

A driver of inspiration and empowerment for the youth of Polynesia

Back

Offshore Blue Academy punctually inviting small groups of Polynesian medium / high-school kids (low season) to visit and understand the circular principle of the SOE, to discover the underwater world, to imagine a possible bright future in harmony with the Ocean, and to envision great opportunities in a Polynesian sector of excellence dedicated to a pioneering symbiotic blue economy.

APPENDIX 11

LINK TO FREQUENT ASKED QUESTIONS

Indigo Civilization
the ocean dwellers
